

IMF POLICY PAPER

FIFTEENTH GENERAL REVIEW OF QUOTAS—QUOTA FORMULA AND REALIGNING SHARES

March 2021

IMF staff regularly produces papers proposing new IMF policies, exploring options for reform, or reviewing existing IMF policies and operations. The following documents have been released and are included in this package:

- The **Main Paper**, prepared by IMF staff and completed on August 2, 2017 for the Committee of the Whole's consideration on September 1, 2017.
- The **Annexes** (Supplement 1), prepared by IMF staff and completed on August 2, 2017.
- The **Statistical Appendix** (Supplement 2), prepared by IMF staff and completed on August 2, 2017.
- The **Chairman's Concluding Remarks**, which reflect the Chairman's understanding of the views expressed during the September 1, 2017 meeting of the Committee of the Whole.

The IMF's transparency policy allows for the deletion of market-sensitive information and premature disclosure of the authorities' policy intentions in published staff reports and other documents.

FIFTEENTH GENERAL REVIEW OF QUOTAS—QUOTA FORMULA AND REALIGNING SHARES

EXECUTIVE SUMMARY

This paper provides background for an initial discussion under the Fifteenth General Review of Quotas (15th Review) in line with the work plan agreed by the Executive Board. It discusses issues related to further reforms of the quota formula and realigning quota shares, based on updated quota data through 2015. A companion paper, to be discussed separately, will address issues related to the size of the Fund and mix of quota and borrowed resources. Both these papers seek to facilitate initial discussions on some of the key issues for the 15th Review. No proposals are made at this stage, recognizing that further deliberations will be needed before the issues under discussion can begin to be narrowed down.

The paper takes stock of discussions on the quota formula to date, including the significant divergences that remain on many key issues. It presents illustrative simulations of possible reforms of the formula, building on previous work as well as technical staff analysis of the types of reforms that might be needed to bridge differences if a consensus were to emerge somewhere near the middle of the range implied by current positions.

The paper also discusses the broader issue of realigning quota shares under the 15th Review, and presents a limited set of simulations to illustrate the potential impact that different quota formulas may have on the distribution of actual quota shares. All these simulations protect the quota shares of the poorest members, and one set of simulations illustrates the potential impact of including an ad hoc increase based on members' voluntary financial contributions.

Approved By
Andrew Tweedie

Prepared by the Finance Department in collaboration with the Statistics Department. The FIN team comprised H. Hatanpaa (lead), M. Albino-War, R. Bhattacharya, H. Chociay, N.-J. Hansen, E. Ozturk, J. Jatene, and S. Rodriguez-Apolinar under the guidance of T. Krueger.

I. INTRODUCTION

1. The Board of Governors has called on the Executive Board to work expeditiously on the Fifteenth General Review of Quotas (hereafter the 15th Review) in line with existing Executive Board understandings and guidance provided by the International Monetary and Financial Committee (IMFC) on October 8, 2016.¹ As set out in the Board of Governors' Resolution, this work should be completed by the Spring Meetings of 2019, and no later than the Annual Meetings of 2019. At its October 8 meeting, the IMFC reaffirmed its commitment to a strong, quota-based, and adequately resourced IMF to preserve its role at the center of the global financial safety net. The IMFC further stated that it was committed to concluding the 15th Review and agreeing on a new quota formula as a basis for a realignment of quota shares to result in increased shares for dynamic economies in line with their relative positions in the world economy and hence likely in the share of emerging market and developing countries (EMDCs) as a whole, while protecting the voice and representation of the poorest members.²

2. This paper is intended as background for an initial discussion under the 15th Review in line with the work plan agreed by the Executive Board.^{3,4} It discusses issues related to further reforms of the quota formula and realigning quota shares, based on updated quota data through 2015. A second paper, also to be discussed in September, will address issues related to the size of the Fund and the mix of quota and borrowed resources.⁵ Both these papers seek to facilitate initial discussions on some of the key issues for the 15th Review. No proposals are made at this stage, recognizing that further deliberations will be needed before the issues under discussion can begin to be narrowed down.

3. The work plan recognizes that a consensus on the key issues for the 15th Review (size and distribution of quotas and new quota formula) will need to be achieved as a package.

Executive Directors held extensive discussions on the quota formula as part of the Quota Formula Review (QFR) completed in January 2013, and concluded that achieving broad consensus on a new quota formula will best be done in the context of the 15th Review rather than on a stand-alone basis.⁶ While Directors have since revisited issues related to the formula and the results of further

¹ Board of Governors Resolution No. 72-1, adopted on December 5, 2016.

² [Commutiqué of the Thirty-Fourth Meeting of the IMFC](#), October 8, 2016, Washington, D.C. In their declaration at the end of the Hamburg Summit on July 7-8 2017, G20 Leaders looked forward to the completion of the 15th Review, including a new quota formula, by the Spring Meetings 2019 and no later than the Annual Meetings 2019.

³ The work plan was set out in Attachment I of [Fifteenth General Review of Quotas—Report of the Executive Board to the Board of Governors](#) (11/2/16).

⁴ The discussion of this paper will take place in a Committee of the Whole format. Under Rule D-3 of the Fund's Rules and Regulations, work on a general review of quotas is to be carried out in the first instance in a Committee of the Whole appointed for this purpose by the Executive Board at least one year prior to the date by which a general review of quotas must be undertaken or promptly if it is decided to conduct a general review before the date by which such a review must be undertaken. The Committee of the Whole for the 15th Review was established on January 30, 2013.

⁵ [Adequacy of Fund Resources—Further Considerations](#) (7/31/2017).

⁶ [Outcome of the Quota Formula Review—Report of the Executive Board to the Board of Governors](#) (1/31/13).

staff work in the context of the annual quota data updates, these discussions in general have not led to any further narrowing of views. The discussion of this paper and the companion paper on *Adequacy of Fund Resources—Further Considerations* will be the first opportunities for the Board to discuss the key issues for the 15th Review since the adoption of the above Board of Governors' Resolution. Experience suggests that achieving broad consensus on these issues will be challenging, and will require a spirit of compromise with the goal of ensuring that the Fund's resources remain adequate and that its governance structure continues to evolve in line with changing global economic realities, thereby helping to preserve international monetary stability.

4. The paper is organized as follows. Section II takes stock of discussions on the quota formula to date, including the significant divergences that remain on many key issues. Section III presents illustrative simulations of possible reforms of the formula, building on previous work as well as technical staff analysis of the types of reforms that might be needed to bridge differences if a consensus were to emerge somewhere near the middle of the range implied by current positions. Section IV discusses the broader issue of realigning quota shares under the 15th Review, and presents a limited set of simulations to illustrate the potential impact that different quota formulas may have on the distribution of actual quota shares. The analysis in this paper is based on the latest quota data through 2015, and the impact of the data update is discussed in more detail in the Annex to this paper. Staff has also prepared additional technical background work in a set of Annexes included as Supplement 1. In preparing this paper, staff has benefitted from outreach with Executive Directors' offices earlier this year, and from Directors' comments at a technical briefing of the Board held on May 30, 2017.

II. QUOTA FORMULA: TAKING STOCK

5. The quota formula has traditionally served as a guide for changes in the structure of quotas, rather than a mechanical rule. The Fund has broad discretion to decide the considerations that should guide decisions on quotas. In practice, the formula provides an important indicator and, since the 8th Review, a significant part of overall quota increases has been distributed based on the formula. However, history provides many examples where other relevant considerations (outside the formula) have been taken into account when deciding on adjustments in members' quotas, which require broad support of the membership (85 percent of the total voting power). Experience also suggests that the formula is more likely to be used in circumstances where it is widely recognized as providing a reasonable measure of members' relative economic positions.

6. Directors have underscored that the formula should conform to certain principles. It should (i) be simple and transparent, so that the basis for differences in relative quota shares is readily understandable, (ii) be consistent with the multiple roles of quotas,⁷ (iii) produce results that are broadly acceptable to the membership, and (iv) be feasible to implement statistically based on timely, high quality and widely available data. These four principles helped guide the Executive

⁷ These include their key role in determining the Fund's financial resources, their role in decisions on members' access to Fund resources, and their close link with members' voting rights. Quota shares also determine members' shares in general allocations of SDRs.

Board's deliberations on the new formula in 2008, and the Board agreed in the context of the QFR that they remain valid. As noted below, however, it is not clear based on recent discussions that the current formula still meets all these principles.

7. The current quota formula was agreed as part of a package of quota and voice reforms in 2008 (2008 Reform).

This was the first change in the quota formula since 1982/83 and was viewed as a major improvement over the previous five formula system.⁸ The new formula included four variables expressed in shares, and was substantially simpler and more transparent than the previous multi-formula approach. It also included a compression factor to reduce the dispersion of calculated quota shares (Box 1). Some of the variables were also updated and modernized from those used in the previous formulas, and the practice of making ad hoc adjustments to the quota data was discontinued. While many members had reservations about aspects of the new formula, the Executive Board considered that it provided a reasonable basis for guiding the second round of ad hoc quota increases agreed under the 2008 Reform.

8. Nonetheless, the Executive Board also considered that further work was needed in several areas. These included the scope for measuring openness on a value-added rather than a gross basis, the appropriate treatment of intra-currency union flows, the appropriate way of capturing financial openness, and how to improve the measure of variability to adequately capture members' potential need for Fund resources. The Board decided to consider these issues based on additional staff analysis before the formula was used again. The inclusion of PPP GDP and compression in the formula had been one of the most difficult aspects of the deliberations, and the Board decided to include these elements in the formula for a period of 20 years (i.e., until 2028), after which the scope for retaining them would be reviewed in light of progress toward convergence between market rate and PPP GDP in EMDCs, and the overall objective of ensuring adequate voice and participation for all members.

9. The formula was used again in the 14th Review, though only to distribute part of the overall increase. In the wake of the global financial crisis, the timetable for the 14th Review was brought forward by two years as part of a far-reaching package of quota and governance reforms that was agreed in late 2010. The agreement included a doubling of quotas and a major realignment of quota shares among members. In the latter connection, it was agreed that the current quota formula should continue to be used for the 14th Review, pending a comprehensive review to be completed before the next general quota increase, and that part of the increase should be distributed using an alternative measure of economic weight, given the widespread misgivings about the formula.⁹ In the end, 60 percent of the overall increase was distributed based on the formula and the remaining 40 percent as ad hoc increases based primarily on the GDP blend variable.

⁸ [Reform of Quota and Voice in the International Monetary Fund—Report of the Executive Board to the Board of Governors](#) (3/28/08).

⁹ [IMF Quota and Governance Reform—Elements of an Agreement](#) (10/31/10).

10. As part of the agreed package of 2010 Reforms, the Board subsequently completed a comprehensive review of the quota formula in January 2013. The QFR covered a wide range of issues, including those highlighted at the conclusion of the 2008 Reform. The Executive Board's report to the Board of Governors concluded that the discussions had provided important building blocks for agreement on a new quota formula that better reflects members' relative positions in the global economy, and that the outcome of the review will form a good basis for the Executive Board to agree on a new quota formula as part of its work on the 15th Review.

11. In terms of the formula variables, GDP is generally seen as the most comprehensive measure of economic size.¹⁰ Market GDP has also been viewed as the single most relevant measure of a member's ability to contribute to the Fund's finances, though it is not the only such measure, and as relevant to a member's potential demand for Fund resources. As noted, PPP GDP was introduced as part of the 2008 Reform as a relevant measure of members' weight in the global economy from the perspective of the Fund's non-financial activities.¹¹ It was agreed in the QFR that GDP should remain the most important variable with the largest weight in the formula and scope to further increase its weight. Consideration would also be given to whether or not the weight of PPP GDP in the GDP-blend variable should be adjusted.

12. Openness seeks to capture members' integration in the world economy. It has been argued that countries that are relatively more open to trade and financial flows may have a greater stake in promoting global economic and financial stability, as well as global trade and financial integration. Openness may also have a bearing on a member's willingness or ability to make financial contributions to the Fund as well as its potential need for Fund resources. A longstanding concern is that openness enters the quota formula on a gross rather than a value added basis, which creates distortions because of double-counting of cross-border flows that can exaggerate the resulting measure of a member's relative economic position. The view has also been expressed that intra-currency union flows should be excluded. It was agreed in the QFR that openness should continue to play an important role in the formula, and concerns regarding this variable should be thoroughly examined and addressed. Several options were examined to bridge the different views, including the possible use of a cap on openness in relation to GDP, but views remained divided. Options were also explored for increasing the weight of financial openness but this did not attract sufficient support.

13. Variability is intended to measure a member's vulnerability to balance of payments shocks and therefore its potential need for Fund financing. However, questions have been raised for some time regarding the extent to which it captures what is intended. Staff has conducted extensive technical analysis of this question that has failed to find a significant relationship between variability and actual or potential demand for Fund resources, or to identify a superior measure that would better capture such demand. This work has also highlighted the high correlation between openness and variability and the potential that this measure can introduce instability and produce counterintuitive results. In the QFR, there was considerable support for dropping variability from the

¹⁰ For additional background on the quota formula variables, see Supplement 1, Annex I.

¹¹ The inclusion of PPP GDP was a compromise: some Directors questioned the inclusion of PPP GDP in the formula, while others would have preferred a larger weight.

formula. Some conditioned this support on other elements of an integrated reform package, including how its weight is reallocated and the adequacy of measures to protect the poorest members. Some continued to see a role for variability.

14. Reserves seek to provide an indicator of a member's financial strength and ability to contribute to the Fund's finances. A reserves measure has long been included in the formula, but differing views have been expressed on its continued relevance and the potential distortions associated with excess reserve accumulation. In the QFR, there was considerable support for retaining reserves with its current weight. Views were also expressed in favor of either increasing its weight or eliminating it.

15. A further issue explored in the QFR, and previously, was the scope for including a measure of actual financial contributions in the formula. Staff has done considerable work on how to capture the different forms of members' financial contributions to the Fund (see Supplement 1, Annex V for an update of this analysis). Views diverged on the merits of including such a measure in the formula, and it was agreed in the QFR to consider whether and how to take into account very significant voluntary financial contributions through ad hoc adjustments as part of the 15th Review.

16. Compression was introduced in 2008 to help moderate the influence of size on the quota formula. In the QFR, it was generally agreed that the formula should continue to include a compression factor for this purpose, and the Board agreed that consideration will be given to whether or not the current level of compression should be adjusted. One view was that the current compression factor had been a difficult compromise that should not be reopened, while others favored increasing the level of compression to give greater voice to small countries and EMDCs as a group.

17. It was also agreed that measures should be taken to protect the voice and representation of the poorest members. Considerable support was expressed for addressing this issue as part of the 15th Review.

18. Directors have revisited issues related to the quota formula on several occasions since the completion of the QFR. These discussions have taken place in the context of the annual updates of the quota data, and staff has presented the results of further analysis of the quota variables as well as illustrative calculations of possible reforms of the quota formula. In general, Directors' views have not changed significantly from those expressed during the QFR discussions, but there appears to have been some weakening in the consensus around the building blocks agreed at that time. Recent views have ranged from the position that the current formula is working well and no further reforms are needed to the view that the formula should be reduced to a single variable—GDP (without compression). There is also a spectrum of views in between these two positions. In light of these divergences, it appears difficult to conclude that the current quota formula still meets the third guiding principle outlined above, namely that it should produce results that are broadly acceptable to the membership. Thus, a key challenge for the upcoming discussions under the 15th Review is how to bridge these differences.

Box 1. The Quota Formula

The current quota formula was agreed in 2008. It includes four variables (GDP, openness, variability, and reserves), expressed in shares of global totals, with the variables assigned weights totaling to 1.0. The formula also includes a compression factor that reduces dispersion in calculated quota shares. The formula is:

$$CQS = (0.5*Y + 0.3*O + 0.15*V + 0.05*R)^k$$

where:

CQS = calculated quota share;

Y = a blend of GDP converted at market exchange rates and PPP rates averaged over a three-year period. The weights of market-based and PPP GDP are 0.60 and 0.40, respectively;

O = the annual average of the sum of current payments and current receipts (goods, services, income, and transfers) for a five-year period;

V = variability of current receipts and net capital flows (measured as the standard deviation from a centered three-year trend over a thirteen-year period);

R = twelve-month average over one year of official reserves (foreign exchange, SDR holdings, reserve position in the Fund, and monetary gold); and

k = a compression factor of 0.95. The compression factor is applied to the uncompressed calculated quota shares which are then rescaled to sum to 100.

Box 2. Staff Work Since the QFR

2013 update: [Quota Formula—Data Update and Further Considerations](#) (6/5/13) and [Annexes](#)

Openness: the staff paper provided further analysis on the characteristics of the variable and identified possible options for addressing the concerns that had been raised in the past. Given the data issues with value-added trade, these options focused on weight adjustments, compression, and caps on the overall boost that individual countries can obtain from openness.

Variability: additional staff work did not identify any significant correlation between this variable and broader measures of balance of payments difficulties as well as underlying vulnerabilities that were resolved without recourse to IMF assistance (previous staff work had focused on the relationship between variability and actual demand for Fund resources).

2014 update: [Quota Formula—Data Update and Further Considerations](#) (7/2/14) and [Annexes](#)

PPP GDP: the staff paper presented an assessment of data quality following the update of the 2011 International Comparison Program and of the distributional impact of increasing the share of PPP GDP.

Openness: update of staff's earlier examination of the openness variable based on the latest data.

Variability: summary of staff's extensive work on variability, dating back to the 2008 reform, which has failed to find evidence of any link between the current variability measure and actual or potential demand for Fund resources, or to identify a superior alternative measure that would better capture such demand.

Box 2. Staff Work Since the QFR (continued)

2015 update: [Quota Formula—Data Update](#) (6/19/15)

PPP GDP and Openness: the staff paper updated previous staff analysis on the characteristics of these variables, noting that key conclusions from previous work remained broadly unchanged.

2016 update: [Quotas—Data Update and Simulations](#) (8/9/16)

Out-of-lineness (OOL): staff calculations showed that, following economic developments, aggregate OOL increased again to close to the level prevailing before the 14th Review.

Quota variables: staff presented a detailed analysis of the distributional impact of each variable and the compression factor. Ratios of variables to GDP (market and blend) were used to identify possible outliers.

Openness: update of previous estimates of the impact of excluding intra-currency union trade.

Country groups: the paper discussed the implications of aligning the classification with the current WEO.

Poorest members: staff provided an update of the definition used in the 14th Review and introduced alternative lists for identifying the poorest members (PRGT, UN LDC and WEO LIDC).

Voluntary financial contributions: staff updated data on the main indicators of financial contributions and illustrated possible ways to combine them.

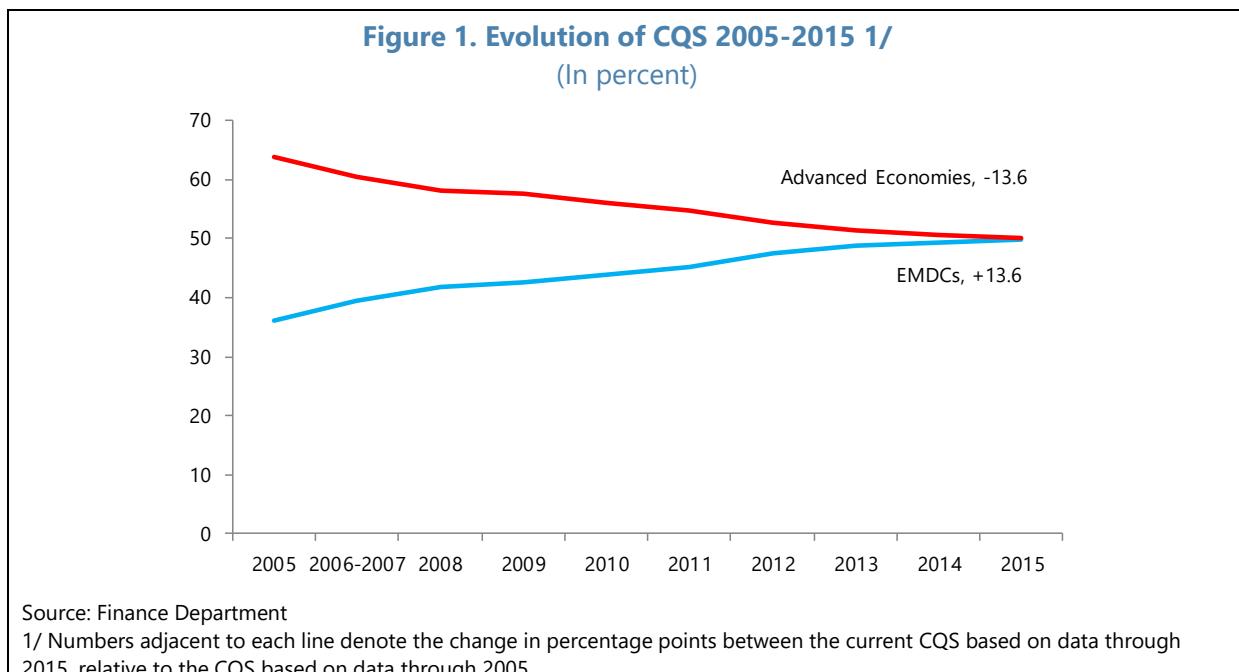

Allocation: illustrative allocations based on selective increases were presented, considering ad hoc elements to protect the poorest members and to take into account financial contributions.

III. DATA UPDATE AND ILLUSTRATIVE SIMULATIONS

19. Staff has updated the quota database by one year through 2015. The results based on the current quota formula are presented in the Annex to this paper.¹² In general, the broad trends observed in previous data updates have continued, with a further 0.5 percentage point increase in the calculated quota share (CQS) of EMDCs as a group to 49.8 percent (Figure 1).¹³ This represents the smallest annual gain since the current quota formula was agreed in 2008. The gain in EMDC shares continues to be centered on Asia, with China recording the largest individual increase (0.6 percentage points). Among the major advanced economies, the CQS of the United States rose slightly while most other countries recorded small declines. An overall measure of the extent to which members' actual quota shares diverge from CQS (out-of-lineness or OOL) has increased further with the latest update and is now slightly higher than was the case prior to the adjustment in shares under the 14th Review.

¹² Results for all members are presented in Supplement 2, Statistical Appendix.

¹³ The results in this paper are based on the same country groupings that have been used for quota work since the 11th Review (including the 2008 Reform and the 14th Review). Staff had proposed aligning the country groups with the current WEO classification (See [Quota—Data Update and Simulations](#) (8/9/16), pp. 48-49). However, Directors' views were mixed at the informal discussion in September 2016 and staff for now has retained the previous classification. The new classification could still be adopted if there is broad support for such a change.

20. In previous papers, staff has presented illustrative simulations of possible reforms of the quota formula. These simulations, which have sought to build on the outcome of the QFR, have (i) retained GDP as the most important variable, and explored different options for the relative weight of market and PPP GDP; (ii) retained openness with a sizable weight, and explored possible options that could address the concerns expressed about this variable; (iii) excluded variability with different options for redistributing its weight;¹⁴ (iv) retained reserves with its current 5 percent weight; and (v) explored the impact of varying the compression factor.

21. Staff has updated these simulations based on the latest data.¹⁵ The results for the main country groups are shown in Table 1. Only the broad results are discussed below, with the implications for individual members' quota shares reported in supplements to this paper.¹⁶ The overall results are broadly similar to those illustrated in the [August 2016 paper](#), though starting from a different base given the data update. The main results can be summarized as follows:

- *Set 1: Simplification of the current formula – dropping variability, keeping current GDP and openness measures.* Dropping variability and allocating part or all of the weight to GDP reduces (compared to the current formula) the CQS of other advanced economies and increases that of major advanced economies and EMDCs as a group. The shifts are larger when the weight of

¹⁴ As noted in Section II, this reform received considerable support in the QFR, though some Directors have conditioned their support for dropping variability on other elements of the reform package. As discussed in previous papers (and summarized in Annex II of [Quota Formula—Data Update and Further Considerations—Annexes](#)), staff has undertaken extensive work to explore the links between variability and actual or potential demand for Fund resources and has found no evidence of such a link (for more details, see also Supplement 1, Annex I).

¹⁵ As in the past, staff could also circulate additional simulations if requested by Executive Directors.

¹⁶ Results for members with the largest quotas and for country groups are presented in Supplement 1, Annex II, and results for all members are presented in Supplement 2, Statistical Appendix.

openness is also reduced. The majority of large countries gain from dropping variability, while around one quarter of small countries gain.¹⁷

- *Set 2: Same as Set 1, but with different combinations of GDP blend.* Increasing the weight of PPP GDP in the GDP blend leads to a higher CQS for EMDCs relative to the current formula. More EMDCs and small countries gain with an increased weight for PPP GDP relative to Set 1. Conversely, increasing the weight of market GDP in the GDP blend reduces the share of both EMDCs and LICs.
- *Set 3: Same as Set 1 but with different openness measures.*¹⁸ Capping openness has been discussed as a possible means to address some of the shortcomings identified with this variable. Caps tend to reduce the CQS of other advanced economies and increase the CQS for major advanced economies and EMDCs as a group. Also, there is generally a larger number of gainers among EMDCs, LICs, and small countries compared with Set 1, including when the weight of openness is reduced, as capping openness redistributes the very large boost received by some countries under the current measure across the rest of the membership.
- *Set 4: Same as Set 1, but with different degrees of compression.* A higher degree of compression reduces the share of the largest economies and increases the share of all other members. As a result, it leads to the largest number of gainers among EMDCs and LICs, as well as among small countries in the simulations of Table 1. Reducing the degree of compression has the opposite impact, with gains for the largest members and reduced shares for all other members.

22. As noted, previous discussions based on similar illustrative simulations to those presented above have not led to a convergence of views. These simulations have illustrated the impact of possible reforms and the trade-offs between different variable specifications. However, there are no indications so far that they are producing results that would be broadly acceptable to the membership. This may partly reflect the fact that these discussions took place during a period when the broader work on the 15th Review was delayed. However, it may also reflect more fundamental differences of view that still need to be reconciled.

¹⁷ Table I.7 in Supplement 1, Annex I presents also a simulation that drops variability and allocates all of its weight to openness, while keeping the current GDP and openness measures. In this simulation, the distribution of CQS would be broadly unchanged relative to the current formula across the largest individual countries and major country groups, highlighting the high correlation between variability and openness.

¹⁸ As discussed in Supplement 1, Annex I, staff has explored the use of a cap to address one possible concern with the openness variable, namely that for some countries it can generate CQS that appear very large in relation to other measures of their relative economic positions.

Table 1. Illustrative Calculations: Summary

	Calculated Quota Share (in percent)				Number of Gainers 1/	of which:		of which: 2/	
	Major Advanced	Other Advanced	EMDCs	LICs		AEs (26)	EMDCs excl. LICs (93)	LICs (70)	Large countries (18)
14th Review Quota Share	43.36	14.28	42.36	3.31					
Current CQS	35.69	14.46	49.84	2.28					
Set 1. Current GDP and openness measures, dropping variability									
1. Weight of variability split evenly between GDP and openness	36.29	13.66	50.05	2.19	59	7	31	21	13
2. Weight of variability split between GDP (2/3) and openness (1/3)	36.36	13.41	50.23	2.20	55	6	28	21	13
3. All weight of variability to GDP	36.51	12.90	50.59	2.23	53	5	27	21	13
4. Weight of openness reduced to 0.25	36.66	12.39	50.94	2.25	51	4	27	20	12
Set 2. Same as Set 1, but with different GDP blends									
1. Weight of variability split evenly between GDP and openness	35.55	13.44	51.01	2.27	66	3	38	25	11
a. 50/50 GDP blend	35.55	13.44	51.01	2.27	66	3	38	25	11
b. 55/45 GDP blend	35.92	13.55	50.53	2.23	67	5	37	25	13
c. 65/35 GDP blend	36.66	13.77	49.57	2.15	54	9	27	18	14
2. Weight of variability split between GDP (2/3) and openness (1/3)	35.59	13.18	51.23	2.28	63	2	36	25	10
a. 50/50 GDP blend	35.59	13.18	51.23	2.28	63	2	36	25	10
b. 55/45 GDP blend	35.98	13.29	50.73	2.24	58	4	30	24	12
c. 65/35 GDP blend	36.75	13.52	49.73	2.16	52	9	24	19	14

1/ Countries with positive change in relation to current CQS.

2/ Countries are classified as "large" if their current GDP blend share exceeds 1.0 percent.

23. Staff has also conducted a technical exercise to explore possible reforms that would generate shares near the midpoint of the range of views expressed so far. This exercise recognizes that compromises will likely be needed on all sides to achieve a result that can command broad support. As noted, views expressed to date have included maintaining the current formula and moving to a GDP only formula proxied by the current blend. As illustrated in the second and third columns of Table 3, these two formulas yield similar results in terms of overall shares between AEs and EMDCs (roughly 50/50). However, they yield very different results for some individual countries and thus would involve a reallocation of CQS within each broad group (in general, moving to a GDP only formula would shift shares from smaller to larger economies). The midpoint between the results of these two formulas is shown in the fourth column.¹⁹

24. Several variants were explored to identify formulas that most closely approximate the midpoint, based on the current quota data. In each case, the underlying parameter restrictions were established upfront (see below), and then alternative combinations were explored to find the best fit with the midpoint. The best fit is defined as the formula that minimizes the sum of the absolute differences between all members' midpoint shares and their respective CQS produced by the formula. The result is purely mechanical and does not involve any further judgment about the relative merits of alternative combinations after the initial parameters have been established. Four variants were explored (see Table 2 for the parameters):

- **Set A: Variants explored in the formula simulations to date:** the range of parameters is defined by the illustrative formulas shown above and in last year's quota data update paper. All combinations of variable weights and other elements (e.g., compression within the range of 0.975-0.925 and absolute or shares caps for openness²⁰) within these parameters are explored to find the best fit to the midpoint. In all simulations, variability is dropped and the weight of reserves is kept at 5 percent. As before, three different combinations for reallocating the weight of variability between GDP and openness are explored, including one where the weight of openness is reduced.
- **Set B: Same as Set A, but with a wider range for the weights on GDP and openness, the split between market and PPP GDP in the GDP blend, and the compression factor:** as in Set A, variability is dropped and the weight of reserves is kept at 5 percent. Other restrictions are substantially relaxed, allowing the range of GDP blends to vary widely (from market-only to PPP-only) in increments of 5 pp; the weights of GDP and openness vary from 0 to 95 percent in increments of 2.5 pp; and the compression factor varies between 0.9 and 1.0 in increments of 2.5 pp.

¹⁹ For example, for the US, its CQS under the current formula is 14.5 percent while its GDP blend share is 20.1 percent. Accordingly, the midpoint in percent is the average of these two numbers, i.e., $17.3 = \frac{1}{2} [14.5+20.1]$.

²⁰ As the measure of openness with shares caps depended on the "openness/GDP blend" ratio, different distributions of openness are calculated according to the GDP blend of each alternative specification.

- Set C: Same as Set B, but allowing the weight on reserves to also vary:** rather than being fixed as in Set B, the weight of reserves is allowed to vary in the range 0 to 10 percent, with 2.5 pp increments. Reflecting this modification, the weights of GDP and openness are allowed to vary from 0 to 100 percent.

Table 2. Parameters for Alternative Formulas—Midpoint Approach

Restriction set	Weights (in percent) 1/					Compression factor
	Market/PPP blend	GDP	Openness 2/	Variability	Reserves	
A. Previous formula simulations	50/50 to 65/35	57.5, 60, 65 or 70	37.5, 35, 30 or 25		5	0.925, 0.950 or 0.975
B. Wider range for GDP, openness, blend and compression	0/100 to 100/0	0 to 95	0 to 95	dropped	0 to 10	0.900, 0.925, 0.950, 0.975 or 1.000
C. Allowing reserves to vary		0 to 100	0 to 100			

1/ When not explicit, variable weights change in 2.5 pp increments. GDP blend changes in 5 pp increments.

2/ All sets allow alternative definitions of openness: absolute caps (85th and 75th percentiles) and shares caps (1.8 and 1.5 ratio). Sets B and C also include openness excluding intra currency union flows.

25. The results of these illustrative simulations are summarized in the last three columns of Table 3. In each case, the results are shown for the combination that yields the closest fit to the mid-point shares consistent with the established parameters.²¹ In general, these simulations suggest that a higher weight for GDP and a lower level of compression would be required to generate results near the midpoint distribution. For example, under Set A where the maximum weight on GDP is limited ex ante to 70 percent, there are still sizable divergences from the midpoint in some cases. These differences are reduced as the restrictions are relaxed (Sets B and C). For the latter two sets of simulations, the closest fit to the midpoint distribution involves a GDP share of 75-77.5 percent, an openness share of 20 percent, a compression factor of 0.975, and a 2.5-5 percent weight on reserves.²²

²¹ Supplement 1, Annex III presents results for additional variable combinations.

²² To improve the fit to the midpoint, staff also experimented with a full relaxation of constraints, allowing variability to be included in the formula. In this setting, the resulting formula has a low weight for variability (around half of current weight), and a much lower weight for openness. For more details, see Supplement 1, Annex III.

1/ Formulas with least total absolute distance from midpoint (column 4), under different sets of restrictions, are as follows:

Set A: $(0.70 * \text{GDP} + 0.25 * \text{Openness} + 0.05 * \text{Reserves})^{0.975}$ with 60/40 GDP blend.

Set B: $(0.75 * \text{GDP} + 0.20 * \text{Openness} + 0.05 * \text{Reserves})^{0.975}$ with 65/35 GDP blend.

Set C: $(0.775 * \text{GDP} + 0.200 * \text{Openness} + 0.025 * \text{Reserves})^{0.975}$ with 60/40 GDP blend.

2/ Including Czech Republic, Estonia, Korea, Latvia, Lithuania, Malta, Singapore, Slovak Republic, and Slovenia.

3/ Including China, P.R., Hong Kong SAR, and Macao SAR.

4/ Currently PRGT-eligible countries. Includes 70 countries.

IV. REALIGNING QUOTA SHARES

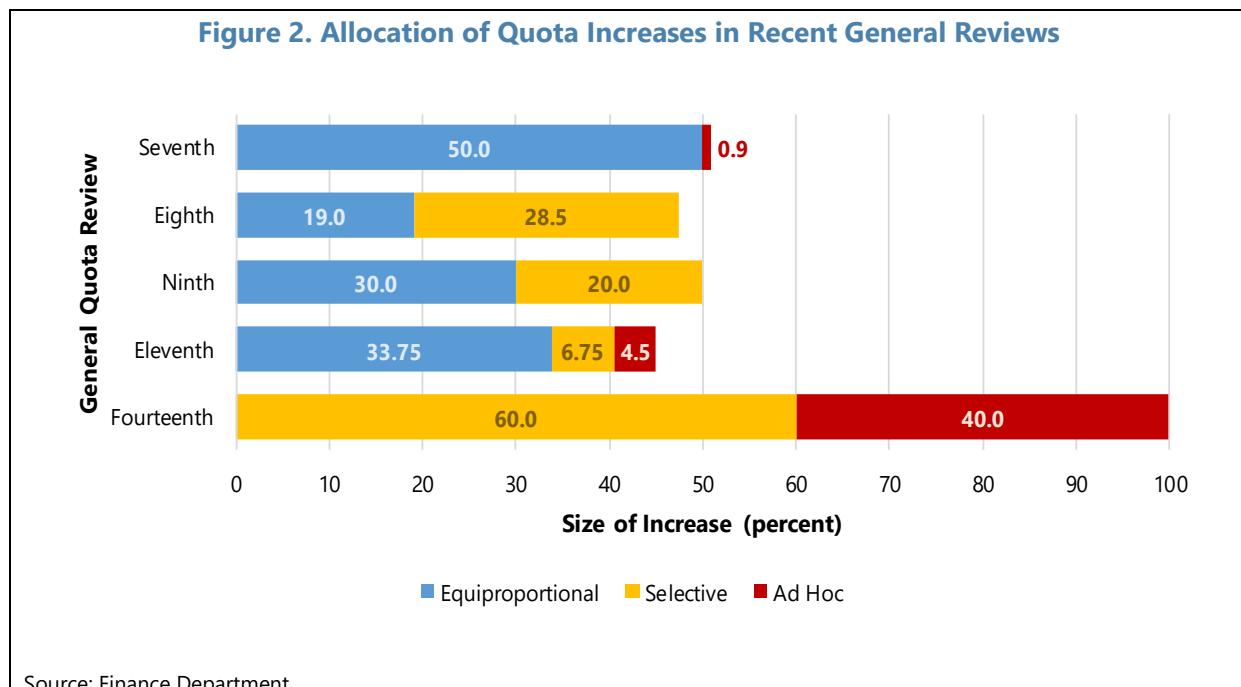

26. As noted, realigning quota shares to reflect members' relative economic positions has been identified as a key goal of the 15th Review. In addition to assessing the overall adequacy of quota resources, the regular five-yearly general reviews of quotas provide an opportunity to realign quota shares. Given the central role played by quotas in the Fund's finances and governance structure, ensuring that quota shares evolve in line with members' changing relative positions remains central to the Fund's continued overall effectiveness.

27. The extent of any realignment depends on the size of the overall quota increase and how it is distributed. Various approaches have been used to distribute general quota increases in the past (Table 4 and Figure 2). Prior to the 14th Review, these typically included a sizable equiproportional element, which goes to all members and leaves existing quota shares unchanged, and a selective element, which is also distributed to all members but based on the results of the quota formula. The latter approach results in a partial adjustment of actual quota shares (AQS) towards CQS, because the new quota shares will reflect a weighted sum of initial AQS and CQS. In the case of a selective increase, the extent of the realignment will therefore depend directly on the size of the overall increase. Ad hoc increases in quotas for a subset of members can also help achieve a broad consensus. This approach can lead to a larger increase in AQS for some members whose shares are considered substantially out of line, or alternatively can limit the dilution of AQS for some other members (for example, protection for the poorest members under the 14th Review). Ad hoc increases can also provide an alternative or supplementary distribution key to the quota formula if, for example, it is not possible to agree on a formula that can command sufficiently broad support. In the 14th Review, 60 percent of the increase was distributed on a selective basis to all members, and the remaining 40 percent as ad hoc increases for a subset of members, primarily based on shares in the GDP blend variable.

Table 4. Methods of Allocation of Quota Increases

	Equiproportional	Selective	Ad hoc
Eligibility	All members	All members	Subset of members
Mechanism	Increase proportional to current quota shares	Increase proportional to calculated quota shares	Based on agreed criteria (possibly including formula)
Impact	Quota shares are not modified	Resulting quota shares are a weighted average of current and calculated quota shares ^{1/}	Variable (may either provide more rapid realignment to a selected metric or limit certain shifts in quota shares)

1/ The weight of current shares will be 100 percent and the weight of calculated shares will be equal to the percentage point increase in total quotas.

28. Given the early stage of discussions, this section presents a very limited set of illustrative simulations of quota share realignments. The main purpose is to illustrate, for a relatively wide range of overall quota increases, the potential impact that different quota formulas may have on the distribution of members' actual quota shares. For simplicity and pending future Board guidance, the simulations all assume that the bulk of the quota increase is distributed based on the formula, i.e., as selective increases. This would require that it is indeed possible to agree on a new quota formula that can command broad support, thus limiting the need for adjustments based on other parameters. As in the 14th Review, no equiproportional increase is assumed (any such increase would tend to dampen the realignments shown in these simulations). In all cases, a relatively small part of the overall increase is allocated as ad hoc increases to protect the quota (and voting) shares of the poorest members. The final set of simulations also illustrates the potential impact of providing additional ad hoc increases to recognize members' voluntary financial contributions to the Fund, an option that was discussed during the QFR.

29. More specifically, the simulations include the following elements:

- **Size of overall increase:** Three purely illustrative alternatives are considered. The first two repeat the analysis presented in the [August 2016 staff paper](#), covering an increase of 70 percent that would broadly maintain the Fund's lending capacity after the bilateral borrowing agreements expire, and an increase (125 percent) that would largely restore quotas to the ratios observed in previous general reviews of quotas based on an average of relevant indicators.²³

²³ As detailed in the companion paper on [Adequacy of Fund Resources—Further Considerations](#) (7/31/17), updated calculations based in these reference points indicate quota increases that are somewhat higher than in the calculations presented in the August 2016 staff paper. Specifically, with a somewhat higher amount of bilateral

During staff's outreach earlier this year, a number of Directors suggested to illustrate the impact of a smaller increase and, in response, results are also presented for a 50 percent increase.²⁴

- **Illustrative quota formulas:** In addition to the current quota formula, which is included to provide a basis for comparison, the results are shown for two alternative quota formulas discussed in Section III. The first is Formula 1.2, which eliminates variability and redistributes two-thirds of its weight to GDP and one-third to openness.²⁵ The second is Set C which, of all the variants considered above, is the formula that most closely approximates the midpoint distribution.
- **Protection of the poorest:** For illustrative purposes, the definition of the poorest members is the same as that used in the 14th Review, namely those countries that are PRGT-eligible and meet the IDA per capita GNI cut-off or twice that amount for small states. Using the FY 2017 IDA cut-off (which is based on calendar year 2015 GNI data), this generates a list of 37 members eligible for protection (compared with 52 members at the time of the 14th Review).²⁶ As in the 14th Review, protection is applied at an individual country level. The "cost of protection" in these illustrative simulations ranges from 0.7 to 0.8 percent.²⁷ Supplement 1, Annex IV discusses alternative protection lists (e.g., the full list of PRGT-eligible countries) that could be considered, and it also illustrates their potential cost implications.
- **Voluntary financial contributions:** The last set of simulations allocates 5 percent of the overall increase as ad hoc increases to a sub-set of members based on their voluntary financial contributions to the Fund. As discussed in previous papers, there are many possible ways of measuring such contributions and staff could conduct further work on this topic based on Directors' guidance.²⁸

agreements now effective in the context of the 2016 Bilateral Agreements, a quota increase of 72 percent would be needed to maintain the Fund's lending capacity when the bilateral borrowing agreements expire; and restoring the ratio of quotas relative to an average of relevant indicators (GDP, current external payments, capital flows to EMDCs, and External Financing Needs) would indicate a quota increase of 124 percent. The latter number is higher than staff's estimate last year (113 percent) and, accordingly, the size simulation related to this benchmark was increased from 115 percent in the August 2016 paper to 125 percent. A quota increase of 117 percent would maintain the Fund's current lending capacity in the absence of any access to borrowed resources (i.e., bilateral borrowing agreements and NAB/GAB).

²⁴ For comparison, the average increase of the five previous general quota reviews that resulted in increases was close to 60 percent.

²⁵ See Table 1, the second formula of Set 1.

²⁶ In addition to these 52 members, Zimbabwe was included in the group of protected countries, despite not being PRGT-eligible at the time of the 14th Review due to arrears. South Sudan joined the Fund after the 14th Review, but received a treatment consistent with the poorest members in the calculation of its quota.

²⁷ The cost of protection is defined as the share of the total quota increase that is allocated in an ad hoc manner to protect the eligible members in the list of poorest countries against a decline in their quota shares.

²⁸ Supplement 1, Annex V updates staff's earlier work on possible composite measures of voluntary financial contributions. The version used here is VFCS II, which aggregates each member's share across four types of contributions, with weights of 0.3 for the NAB, 0.3 for 2012 and 2016 bilateral borrowing agreements, 0.2 for PRGT loans and concessional financing subsidies combined, and 0.2 for capacity development.

30. Summary results for major country groups and the 35 members with the largest quotas are presented below (Tables 5–9). The following points may be noted:

- All the simulations result in an increase in quota share of EMDCs as a group, in line with the expectation in the IMFC's October 2016 Communique. As expected for a distribution that is mainly selective, the size of the realignment increases with the size of the overall increase.
- When the current quota formula is used as the primary distribution key, the realignment results in a shift in quota share of 2.6 – 4.4 pp from the major advanced economies to EMDCs, with the share of other advanced economies as a group being largely unchanged.
- When formula 1.2 is used, the overall shifts are broadly similar to those based on the current formula. The aggregate shift to EMDCs is modestly higher (2.8 – 4.6 pp), while the share of other advanced economies declines modestly.
- When the midpoint Set C formula is used, the overall shift to EMDCs as a group is also modestly higher than with the current formula (2.7 – 4.6 pp), while the decline in share of major advanced economies is lower (-1.8 – -3.0 pp) and there is a somewhat larger decline in the share of other advanced economies.
- The inclusion of ad hoc increases to recognize voluntary financial contributions reduces the aggregate shift towards EMDCs in the example illustrated here to 2.3 – 3.8 pp.
- The aggregate share of LICs declines modestly, reflecting net declines for the group of low income countries that are not eligible for protection.
- As shown in Tables 6 – 9, the use of different formulas has a significant impact on quota share for some individual countries. In particular, given the heavy weight of selective increases in these simulations, the results are heavily dependent on whether and to what extent individual countries are under- or over-represented under the formulas, and also on the size of the quota increase.

31. It should be stressed that the illustrative simulations presented above are solely intended to help inform Directors' initial discussions on some of the key issues for the 15th Review. Based on Directors' views, staff will build on this work in future papers, recognizing that the various elements of the review, including the quota formula, the size of any quota increase, and the various methods available to distribute such an increase, are closely inter-linked. These elements will need to come together as a self-reinforcing package in order to command the necessary broad support for an agreement on the 15th Review.

Table 5. Illustration of Allocation Mechanisms: Summary

	Size of Overall Increase	Actual Quota Shares (in percent)			
		Major Advanced	Other Advanced	EMDCs	LICs
14th Review Quota Share		43.36	14.28	42.36	3.31
Based on the Current Formula:					
(0.50*GDP + 0.30*Openness + 0.15*Variability + 0.05*Reserves)^0.95	50 percent	40.73	14.31	44.97	3.19
	70 percent	40.11	14.31	45.58	3.16
	125 percent	38.97	14.33	46.71	3.10
Based on Formula 1.2:					
(0.60*GDP + 0.35*Openness + 0.05*Reserves)^0.95	50 percent	40.94	13.95	45.11	3.19

Source: Finance Department

1/ All simulations show distributions based on the quota formula (i.e., selective increases) plus ad hoc increases where needed to protect the shares of the poorest members and with 5 percent of the overall increase allocated as ad hoc increases based on voluntary financial contributions.

2/ Voluntary financial contributions are based on VFCS II, which is the weighted average of contribution shares, with weights of 0.3 for NAB, 0.3 for 2012 and 2016 bilateral borrowing agreements, 0.2 for PRGT loans and concessional financing subsidies combined, and 0.2 for capacity development. See Supplement 1, Annex V for details.

3/ Including Czech Republic, Estonia, Korea, Latvia, Lithuania, Malta, Singapore, Slovak Republic, and Slovenia.

4/ Including China, P.R., Hong Kong SAR, and Macao SAR.

5/ Currently PRGT-eligible countries.

6/ Updated 14th Review list to include countries that are PRGT-eligible and meet the FY 2017 IDA per capita GNI cut-off of US\$1,185 (data through 2015) and twice that amount for small states, as defined by the IMF. Currently includes 37 member countries.

V. ISSUES FOR DISCUSSION

32. This paper seeks to provide a basis for an initial discussion of the Committee of the Whole on the 15th General Review of Quotas. It focuses on the quota formula and realignment of quota shares under the 15th Review. A companion paper to be discussed separately addresses issues relating to the size of the Fund and the adequacy of quota resources.

33. The paper does not make any proposals on the quota formula at this stage, pending further Board guidance on possible approaches to bridging the remaining differences. While Directors have had several opportunities to discuss the quota formula in recent years, significant differences of view remain on the extent and direction of needed reforms. Against this background, the paper updates earlier simulations of possible reforms using data through 2015, and presents some additional technical simulations of reforms that produce results broadly around the middle of the range of views expressed in discussions so far.

34. The paper also includes a brief discussion of possible broad approaches to distributing quota increases under the 15th Review. Only a very limited set of simulations is included at this early stage of the discussions, mainly to illustrate the potential impact that different quota formulas may have on the distribution of members' actual quota shares. All these simulations protect the quota shares of the poorest members, and one set of simulations illustrates the potential impact of including an ad hoc increase based on members' voluntary financial contributions. It is recognized that considerable further work will be needed as discussions advance on the closely-related questions of the formula and the appropriate size of total quotas.

35. Directors may wish to comment on the following:

- What do Directors see as the most promising approaches to a reform of the quota formula that could command broad support? Do they still see scope for a possible landing point within the range of reforms that has been considered in previous update papers?
- How do Directors view the outcome of staff's technical work on reforms that produce results around the middle of the current range of views, and do they see merit in further exploring reforms that would build on this work?
- Are there other possible reforms of the formula beyond those considered to date that could help to broaden support?
- What are Directors' initial views on the possible approaches to realigning quota shares, and what do they see as the most promising areas for further work? Are there particular elements that would be helpful in advancing the discussions and helping guide future staff work?
- Do Directors have views on the options for measuring voluntary financial contributions presented in Supplement 1, Annex V and are there additional areas of work that would be helpful?
- Do Directors have any further views at this stage on how to define the list of the poorest members (discussed in Supplement 1, Annex IV) that would be eligible for protection under the 15th Review?

Annex I. Updated Quota Database

A. Developments in Calculated Quota Shares

1. Staff has updated the quota database through 2015. The update advances by one year the data presented last August,¹ using the same sources as in past updates (see Box 1 and the Statistical Appendix). The new data continue the broad trends observed previously, but the shifts between the main country groups are generally smaller. Calculated quota shares (CQS) for the main country groups and individual members are shown in Table I.1a and Statistical Appendix Table A1.² These results and those presented in the rest of this section are based on the current quota formula and country group classifications.³

2. The data update results in a modest further increase in the CQS of EMDCs as a group. Their aggregate share increases by 0.5 percentage points (pp) to 49.8 percent (Tables I.1a and I.1b), which constitutes the smallest overall gain relative to the previous year for EMDCs since the current quota formula was agreed in 2008. EMDC shares in Asia continue to record gains, driven by China, while the share of transition economies declines slightly, and EMDC shares in other regions remain broadly stable. Among the advanced economies (AEs), the share of the major AEs declines by 0.4 pp which is about half of the decline in the last update (0.7 pp). Among major AEs, the US share increases (0.2 pp) while the shares of other countries decline or remain broadly unchanged. The share of other AEs as a group decreases by 0.1 pp, offsetting an increase of 0.1 pp in the previous update. These results are in part indicative of a narrowing growth differential between EMDCs and AEs and, as indicated below, also of the appreciation of the U.S. dollar over the underlying data period.

3. The cumulative shifts in CQS over a longer timeframe have been sizable:

- *The aggregate shift to EMDCs has been 13.6 pp since the current quota formula was agreed in 2008 based on data through 2005* (Figure I.1 and Table I.1a). China has accounted close to half (6.2 pp) of this increase, with India (1.1 pp), Saudi Arabia (0.8 pp)⁴, Russia and Brazil (both 0.5 pp) also recording sizable gains. The aggregate share of low income countries (LICs) increased by more than one third.⁵ Among AEs, the major advanced economies' share declined by 11.9 pp, with the US and Japan accounting for about two thirds of this decline. Over the same period, the share of other advanced economies as a group declined by 1.7 pp.

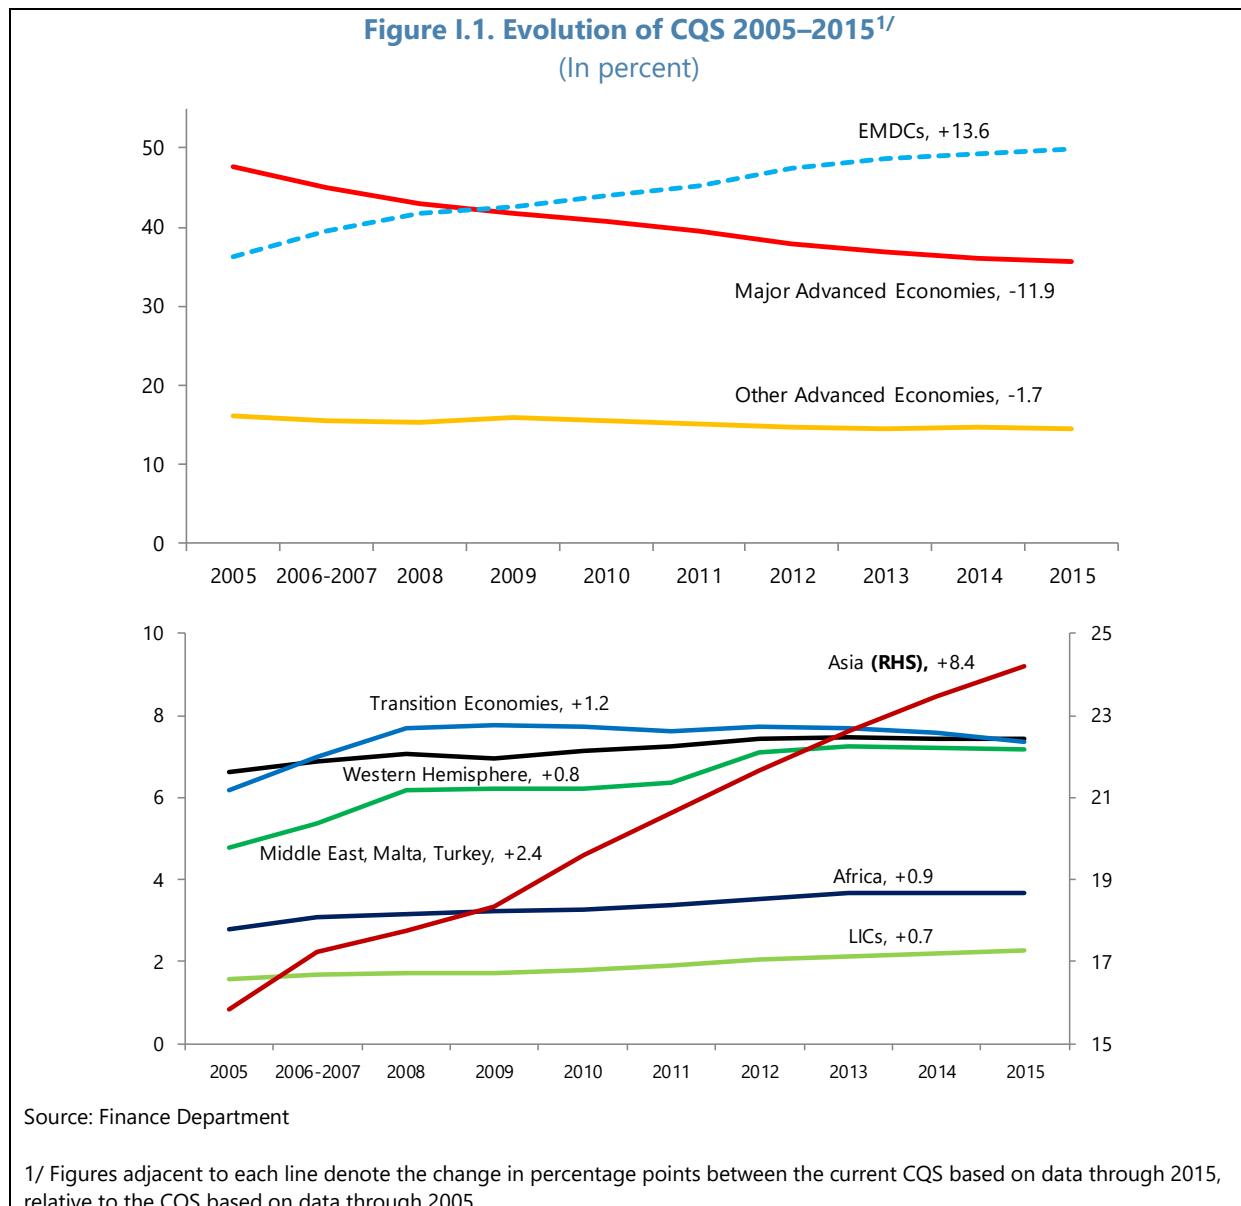

¹ [Quota Formula—Data Update and Simulations](#) (8/9/16).

² Individual country data and simulation results, as well as some additional technical material, are presented in Supplement 2, Statistical Appendix.

³ The current formula is $CQS = (0.50 \cdot GDP + 0.30 \cdot Openness + 0.15 \cdot Variability + 0.05 \cdot Reserves)^k$. GDP is blended using 60 percent market and 40 percent PPP exchange rates; K is a compression factor of 0.95; see Box 1.

⁴ Numbers presented in text may differ from those calculated using figures from the Tables shown in this Annex due to rounding.

⁵ LICs are defined as countries that are currently PRGT eligible.

- The CQS of EMDCs has increased by 8.1 pp since the 14th Review, which was based on data through 2008. Over this 7-year period, by far the largest increase was recorded by China (4.7 pp), while India (0.7 pp), Indonesia (0.4 pp), and Saudi Arabia (0.3 pp) also recorded sizable gains. Asia accounted for about four-fifths of the total gains for EMDCs. The CQS of LICs increased by 0.6 pp. Among AEs, the combined CQS of the major advanced economies declined by 7.2 pp. All countries in this group lost CQS, with the US (-2.5 pp), Japan (-1.4 pp), and the UK (-1.1 pp) experiencing the largest falls. The share of other advanced economies declined by 0.9 pp, with Spain (-0.5 pp) recording the largest decline and Switzerland experiencing the largest gain (0.5 pp).

- CQS changes in relative terms, i.e., measured in percent, have varied widely (Table I.1b). Among the larger EMDCs, China saw the largest relative increase in its CQS since the 14th Review (58.9 percent), followed by Indonesia (44.9 percent) and Nigeria (39.2 percent). In addition, the CQS for India increased by close to a third and the CQS for Saudi Arabia and Thailand increased by about a quarter. For major AEs, the decline in CQS ranged from 23.5 percent for the UK to 11.9 percent for Canada. Among other AEs, changes in CQS varied widely, with Switzerland (40.5 percent) recording the largest gain and Greece (-39.0 percent) and Ireland (-28.4 percent) the largest declines.

Box I.1. Data Sources and Methodology¹

The data sources and methodology remain closely in line with past practice. The primary data source is the Fund's *International Financial Statistics (IFS)*. Missing data were supplemented in the first instance by the *World Economic Outlook (WEO)* database. Remaining missing data were computed based on staff reports and, in very few instances, country desk data. As is customary, a cutoff date of January 31, 2017 for incorporating new data in the quota database was employed for *IFS*; consistent with this cutoff, the Fall 2016 publication was used for *WEO* data.

The PPP GDP data are calculated by dividing a country's nominal GDP in its own currency by its corresponding PPP factor. The 2011 *International Comparison Program (ICP)* PPP factors were extended to include 2012–15 using *WEO* methodology.

Data for openness and variability reflect the ongoing implementation of BPM6, introduced in the 2013 quota data update. Country coverage has broadened with this update to include 133 BPM6-data reporting members compared with 120 previously. Under the BPM6 methodology, the full value of goods for processing is no longer counted under the reported (gross) exports and imports (these are goods processed under contract for an explicit fee by a non-resident processing entity, where the goods being processed do not change ownership); rather only the fees from processing are recorded under services. As discussed in Annex I of [Quota Formula—Data Update and Further Considerations](#) (6/5/13), the overall impact of this change is relatively modest.

1/ See the Statistical Appendix for additional details.

- 4. The most recent gain in CQS for EMDCs reflects increases in shares of most quota formula variables, particularly GDP, consistent with continued divergence in global growth rates.** With the slowdown in the growth rate in EMDCs since the latest update, the growth divergence has narrowed further but nonetheless remains sizable (Figure I.2 upper panel). As a result, the aggregate share of EMDCs in the GDP blend increased by 0.8 pp (Tables I.2a and I.2b). Notwithstanding the slight decline in external flows from 2014 to 2015, EMDCs recorded modest gains in their shares of global openness (based on average for 2011–2015) and variability (Figure I.2 lower panel, and Table I.2a). The share of EMDCs in global reserves declined to 75.2 percent from 76.7 percent. This decline reflects mainly losses in the shares of China (-0.9 pp) and Russia (-0.7 pp), only partly offset by increasing shares in several EMDCs across regions, and particularly in India and Korea.

1/ These results are based on the current quota formula: CQS = (0.50*GDP + 0.30*Openness + 0.15*Variability + 0.05*Reserves)^k. GDP blend using 60 percent market and 40 percent PPP exchange rates. K is a compression factor of 0.95.

2/ The "2008 Reform" reflects quotas after the "second round" ad hoc quota increases for 54 members agreed in 2008, following the "first round" ad hoc increases for four members agreed in 2006. Includes South Sudan and Nauru which became members on April 18, 2012 and April 12, 2016, respectively. For the two countries, Somalia and Sudan, that have not yet consented to and paid for their quota increases, 11th Review proposed quotas are used.

3/ Includes South Sudan and Nauru which became members on April 18, 2012 and April 12, 2016, respectively; reflects their quota increases proposed in their respective membership resolutions after the effectiveness of the 14th Review.

4/ Reflects the impact of adjustments to current receipts and payments for re-exports, international banking interest, and non-monetary gold.

5/ Including Czech Republic, Estonia, Korea, Latvia, Lithuania, Malta, Singapore, Slovak Republic, and Slovenia.

6/ Including China, P.R., Hong Kong SAR and Macao SAR.

7/ Currently PRGT-eligible countries.

1/ These results are based on the current quota formula: $CQS = (0.50 \cdot GDP + 0.30 \cdot Openness + 0.15 \cdot Variability + 0.05 \cdot Reserves)^k$. GDP blend using 60 percent market and 40 percent PPP exchange rates. K is a compression factor of 0.95.

2/ Reflects the impact of adjustments to current receipts and payments for re-exports, international banking interest, and non-monetary gold.

3/ Including Czech Republic, Estonia, Korea, Latvia, Lithuania, Malta, Singapore, Slovak Republic, and Slovenia.

4/ Including China, P.R., Hong Kong SAR and Macao SAR.

5/ Currently PRGT-eligible countries.

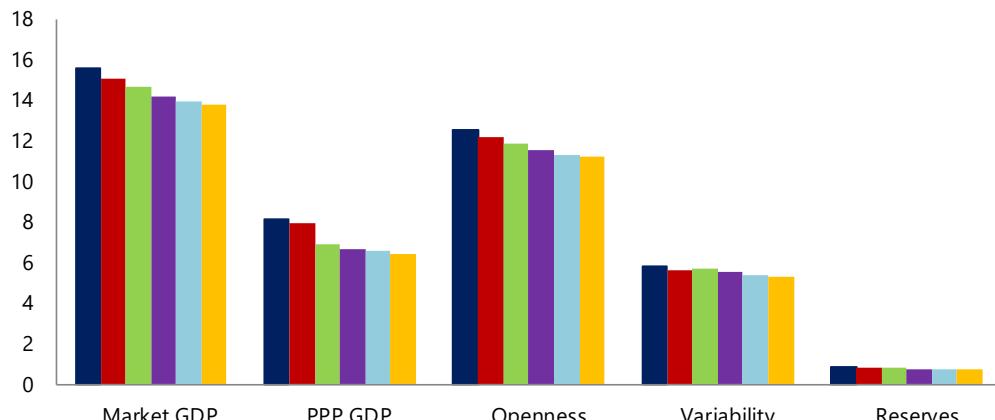

5. Figure I.3 shows the contributions of the five quota variables to CQS for major groups during the last five data updates.⁶ For EMDCs as a group, the rising shares of market GDP, PPP GDP, and openness have been the main contributors to the increases in their CQS (Figure I.3, bottom panel). For the major advanced countries, the reverse applies as this group has steadily lost share across all three variables. Market GDP continues to make the most important contribution to CQS for this group, whereas for EMDCs, the contributions of market GDP, PPP GDP, and openness are broadly similar (reflecting their larger share of PPP GDP, which has a lower weight in the formula). Openness and variability combined contribute roughly 60 percent of the CQS for other advanced economies as a group (for a more comprehensive discussion on the relationship between openness and variability, see Supplement 1, Annex I).

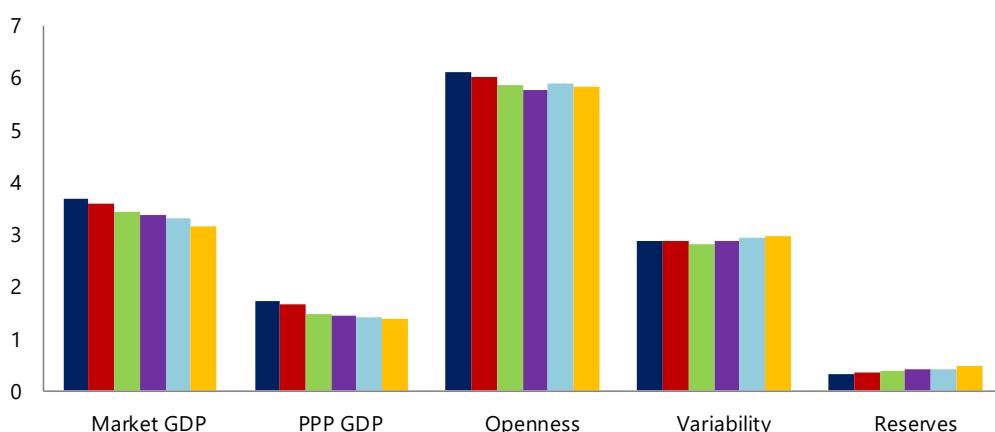

⁶ The contribution of each quota variable is defined as each major group's aggregate share multiplied by its coefficient in the quota formula (e.g., 0.3 for market GDP and 0.2 for PPP GDP). The contributions will not equal the corresponding CQS due to compression.

Figure I.3. Contributions of Country Groups and Quota Variables to CQS
(In percentage points)

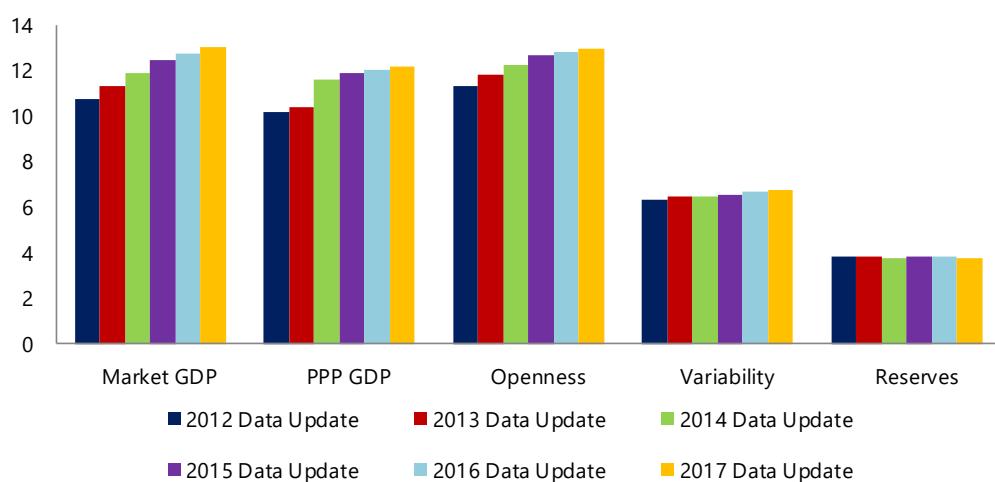

Major Advanced Economies--CQS 35.7 Percent

Other Advanced Economies--CQS 14.5 Percent

EMDCs--CQS 49.8 Percent

1/ Includes South Sudan and Nauru which became members on April 18, 2012 and April 12, 2016, respectively; reflects their quota increases proposed in their respective membership resolutions after the effectiveness of the 14th Review.

2/ Based on the following formula: CQS = (0.50*GDP + 0.30*Openness + 0.15*Variability + 0.05*Reserves)^k. GDP blended using 60 percent market and 40 percent PPP exchange rates. K is a compression factor of 0.95.

3/ Based on IFS data through 2015.

4/ Based on IFS data through 2014.

5/ Current PPP-GDP data were retrieved from the WEO database for 186 countries. For the countries with no WEO data (Nauru, Somalia and Syrian Arab Republic), PPP-GDP was gap filled.

6/ GDP blend using 60 percent market and 40 percent PPP exchange rates.

7/ Including Czech Republic, Estonia, Korea, Latvia, Lithuania, Malta, Singapore, Slovak Republic, and Slovenia.

8/ Including China, P.R., Hong Kong SAR, and Macao SAR.

9/ Currently PRGT-eligible countries.

6. As in previous updates, there were sizable absolute changes in CQS for some individual members (Table I.3a). Among the largest gainers, China again recorded the largest individual increase in CQS (0.56 pp) broadly in line with the last update. Two AEs, the U.S. and Switzerland were the next largest gainers. For the U.S., the 0.16 pp increase in CQS reflected mainly a higher share in market GDP, driven by a stronger dollar. The gains for Switzerland were mainly associated with higher shares in variability and reserves. Seven of the 10 largest declines in CQS were for AEs, with Japan (-0.20 pp) and Germany (-0.11 pp) registering the largest individual declines mainly due to lower shares in market GDP. Declines in other AEs are mainly explained by lower shares in both market GDP and openness.

1/ Current and previous calculations are based on data through 2015 and 2014 respectively, using the existing formula.

2/ Difference in the shares for each variable between the current and previous datasets, multiplied by the variable weight in the quota formula. The change in CQS also reflects the effect of compression.

3/ GDP blended using 60 percent market and 40 percent PPP factors.

4/ Including China, P.R., Hong Kong SAR and Macao SAR.

7. Changes in percent of CQS were large for some individual members. Grenada had by far the largest relative gain in its CQS, which increased by a quarter compared to its CQS in the previous data update, explained mainly by gains in the share in variability. Kiribati and Venezuela also recorded large relative increases in their CQS, in the former case mainly driven by gain in the country's share in variability and in the latter case driven by a gain in the share in market GDP.⁷ The three countries with the largest relative declines in CQS (ranging from 11 to 19 percent) were San Marino, South Sudan and Tuvalu. The declines for San Marino and South Sudan are explained mainly by openness and variability. The decline for Tuvalu is mainly explained by reserves.

⁷ For Venezuela, the reported increase in market GDP reflects the combined effects of very high inflation rates and distortions in the official exchange rate.

1/ Current and previous calculations are based on data through 2015 and 2014 respectively, using the existing formula.

2/ Difference in the shares for each variable between the current previous datasets, multiplied by the variable weight in the quota formula and divided by the weighted sum of variables in the previous dataset. The relative change in CQS also reflects the effect of compression.

3/ GDP blended using 60 percent market and 40 percent PPP factors.

B. Developments in Out-Of-Lineness

8. Out-of-lineness (OOL) based on the current formula has increased further. Comparing CQS with 14th Review quota shares, at the aggregate level AEs are over-represented and EMDCs under-represented by 7.5 pp, compared with 7.0 pp in the previous update (Table I.4). The number of underrepresented members decreased slightly to 71 compared with 73 in the previous update.

9. These developments illustrate that calculated quota shares can over time depart significantly from actual quota shares given the periodic nature of quota adjustments.

- **The 14th Review quota increases resulted in a major reduction of OOL.** Aggregate OOL for the membership would have been more than halved if the new quotas had become effective immediately after the 14th Review was completed in 2010 (Figure I.4).
- **Subsequent economic developments have increased aggregate OOL again and this measure is now slightly above the level prevailing before the 14th Review.** The 71 countries that are now under-represented based on the current formula have an aggregate OOL of about 11.8 pp. Within this group, one country—China—accounts for roughly half the aggregate OOL (6.2 pp), compared with about one-third prior to the 14th Review (3.9 pp). Excluding China, the degree of OOL among under-represented countries is lower than it was at the time of the 14th

Review (decline from 6.8 pp to 5.6 pp). Among over-represented countries, the US, Japan, and France currently account for 45 percent of the total OOL, and as a group, major advanced economies now account for about two-thirds of the aggregate over-representation. These results are obviously sensitive to the quota formula used to measure CQS and a different formula could generate a different OOL distribution.⁸ However, they also highlight the importance of making periodic adjustments in quota shares to reflect members' changing relative positions in the global economy.

Table I.4. Under- and Overrepresented Countries by Major Country Groups^{1/}
(In percent)

1/ Under- and over-represented countries for the two datasets, respectively.

2/ Includes South Sudan and Nauru which became members on April 18, 2012 and April 12, 2016, respectively; reflects their quota increases proposed in their respective membership resolutions after the effectiveness of the 14th Review.

3/ Difference between calculated quota shares and 14th General Review quota shares.

4/ Based on IFS data through 2015.

5/ Based on IFS data through 2014.

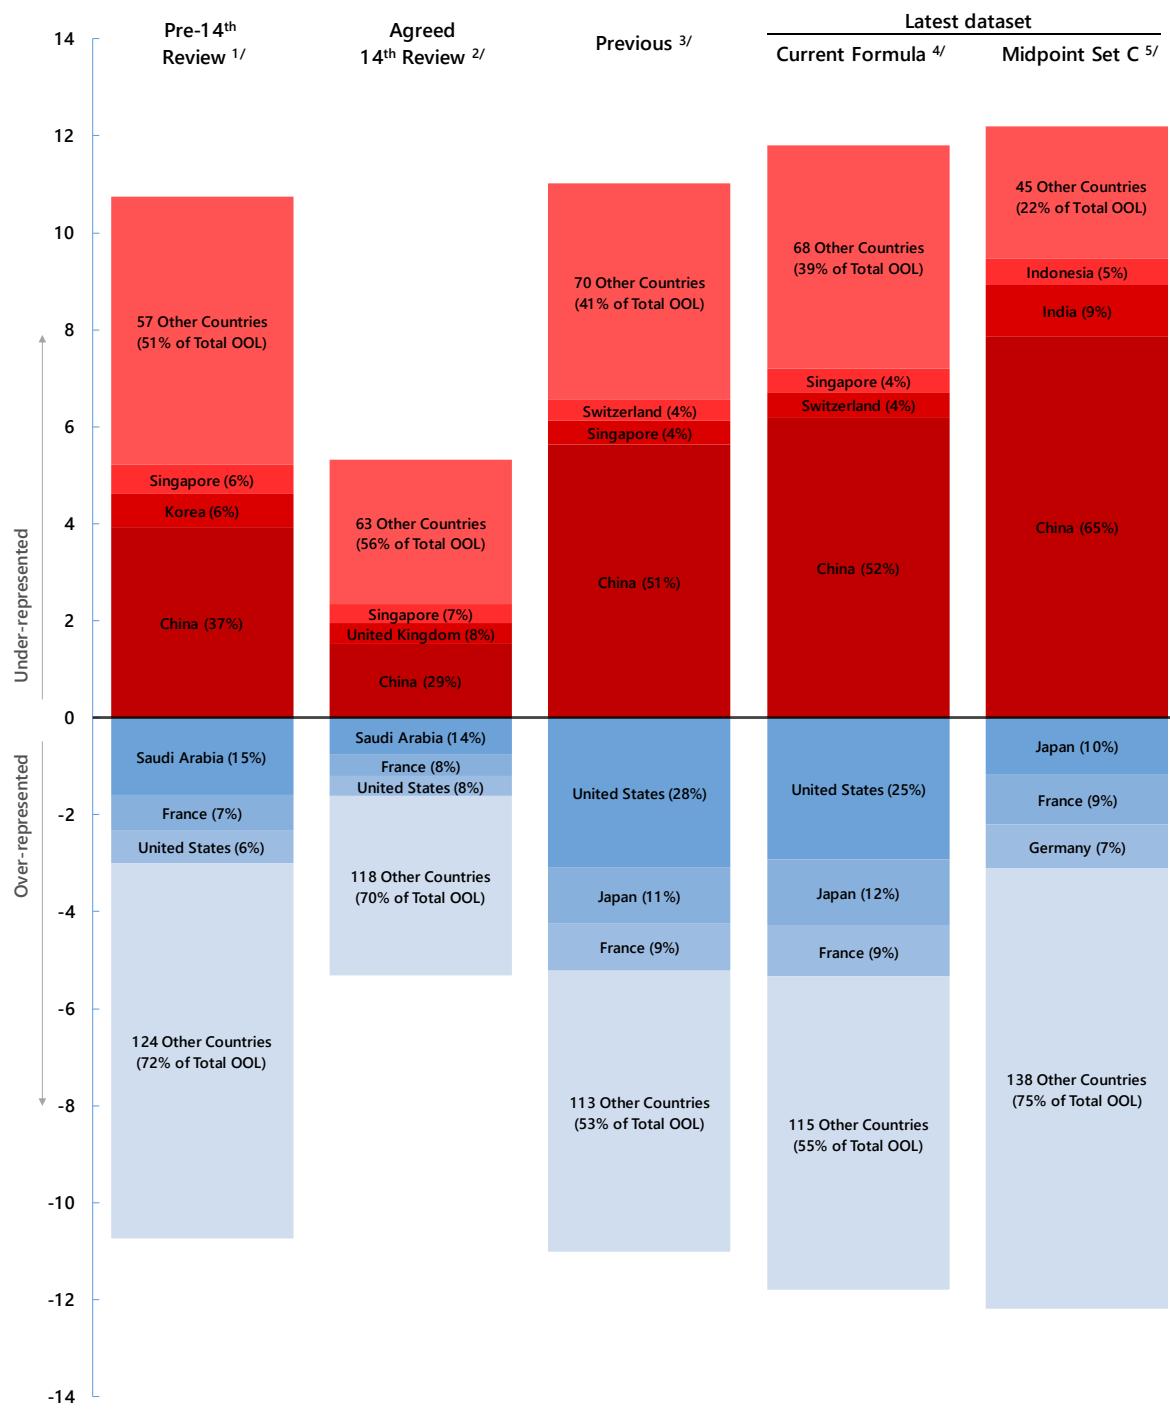

6/ The "2008 Reform" reflects quotas after the "second round" ad hoc quota increases for 54 members agreed in 2008, following the "first round" ad hoc increases for four members agreed in 2006. Excludes South Sudan and Nauru which became members on April 18, 2012 and April 12, 2016, respectively. For the two countries, Somalia and Sudan, that have not yet consented to and paid for their quota increases, 11th Review proposed quotas are used.

7/ Difference between calculated quota shares based on IFS data through 2008 (14th Review) and 2008 Reform quota shares.

8/ Currently PRGT-eligible countries.

⁸ Staff has looked at the OOL implied by some other alternative formulas discussed in the main text. These tend to show a similar overall level of OOL to the current formula at the aggregate level, though the composition can change significantly (see, for example, the results for the midpoint set C formula shown in Figure I.4). China would account for around half or more of total under-representation in all these cases.

Annex I. Quota Formula Variables

This annex updates previous analysis of the distributional effects of the quota formula variables, using the latest data, and discusses alternative measures of openness.

A. Overview of Quota Variables

- 1. The quota formula seeks to capture the multiple roles of quotas.** These include their key role in determining the Fund's financial resources, their role in decisions on members' access to Fund resources, and their close link with members' voting rights. Quota shares also determine members' shares in a general allocation of SDRs. Thus, the formula has typically sought to capture members' relative positions in the world economy, their financial strength and ability to contribute usable resources, as well as their potential need to borrow from the Fund. Some individual quota variables are intended to capture more than one aspect.
- 2. The current quota formula was agreed in 2008 and includes four variables and a compression factor.** The four variables are GDP (measured as a blend of market and PPP GDP), openness, variability, and reserves. All of them are expressed in shares of global totals, with the variables assigned weights totaling to 1.0. The formula also includes a compression factor that reduces dispersion in calculated quota shares.¹
- 3. Figure I.1 presents the calculated quota shares of major country groups and their shares in each variable in the quota formula, based on the latest data update.** A few points are worth noting: (i) the aggregate shares of advanced economies (AEs) and emerging market and developing countries (EMDCs) in the GDP blend variable are broadly equal; (ii) AEs have a larger share in openness and variability, reflecting the relatively large share for the group of other advanced economies (more than double their share in GDP); (iii) EMDCs have a much larger share in the reserves variable; and (iv) the aggregate group shares in openness and variability are broadly identical.
- 4. The quota variables are all partly related to economic size, and therefore are quite highly correlated in most cases.** The correlations between variables are shown in Table I.1. At the aggregate level, the correlations between GDP, openness, and variability are relatively high, while shares in reserves are less correlated with the other variables. This is particularly the case for AEs, where there is a very low correlation between reserves and the other variables. Excluding the ten largest members (by GDP blend share), the correlations between the GDP blend variable and the other variables in the quota formula decline significantly, while the correlation between openness and variability remains very high.
- 5. These effects can be observed also in the relationship between market GDP shares and shares of the other quota formula variables.** Figure I.2 plots this relationship using the latest data through 2015. As can be seen from the upper left-hand side (LHS) panel, the relationship between

¹ The current formula is $CQS = (0.50 \cdot GDP + 0.30 \cdot Openness + 0.15 \cdot Variability + 0.05 \cdot Reserves)^k$. GDP is blended using 60 percent market and 40 percent PPP exchange rates; K is a compression factor of 0.95.

members' shares in the GDP PPP variable and market GDP is reasonably close for most members. However, there is a clear distinction between advanced economies and EMDCs: all AEs have higher shares in market GDP than in PPP GDP, while the converse is true for almost all EMDCs. The dispersion is wider for openness and variability (upper RHS and lower LHS), where a number of smaller AEs have significantly higher shares than in market GDP (and conversely, some larger AEs have larger shares in GDP). A marked differentiation among country groups is evident for reserves, with several large EMDCs having higher shares in reserves in relation to market GDP, while the reverse is true for most AEs (lower RHS).

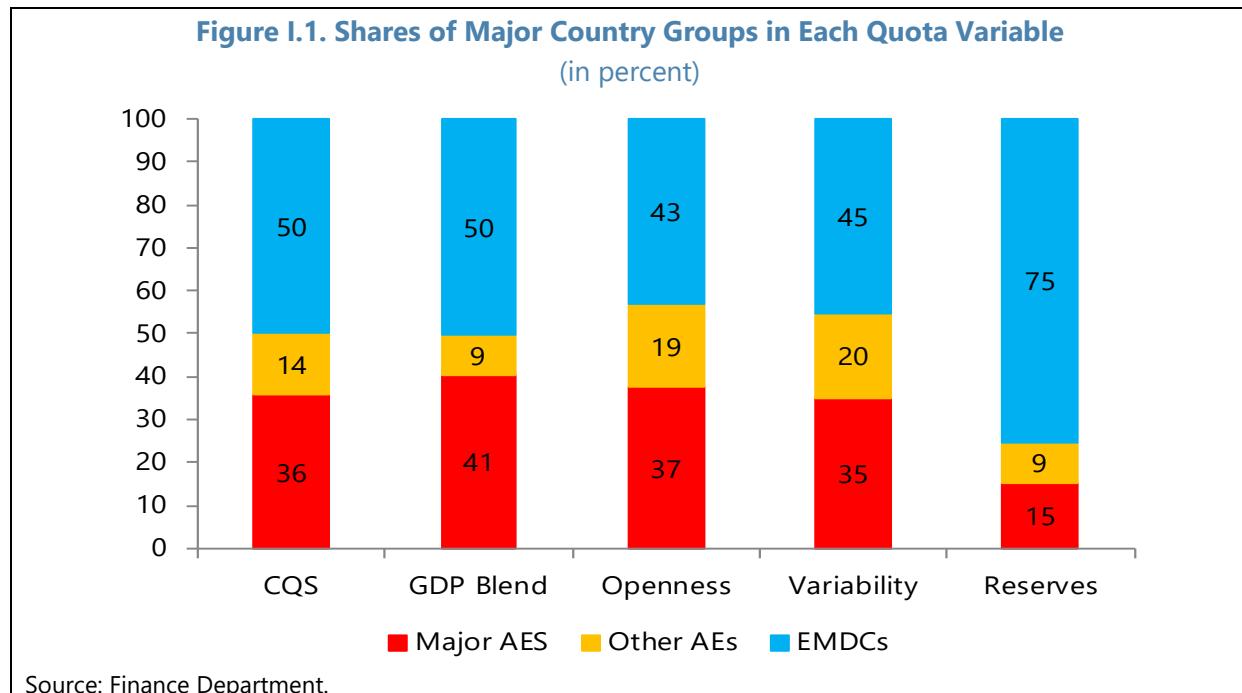

Table I.1. Correlation between Quota Variables

Advanced Economies		All Members 1/			
		GDP Blend	Openness	Variability	Reserves
GDP Blend	1.00				
Openness	0.92	1.00			
Variability	0.95	0.98	1.00		
Reserves	0.23	0.22	0.31	1.00	

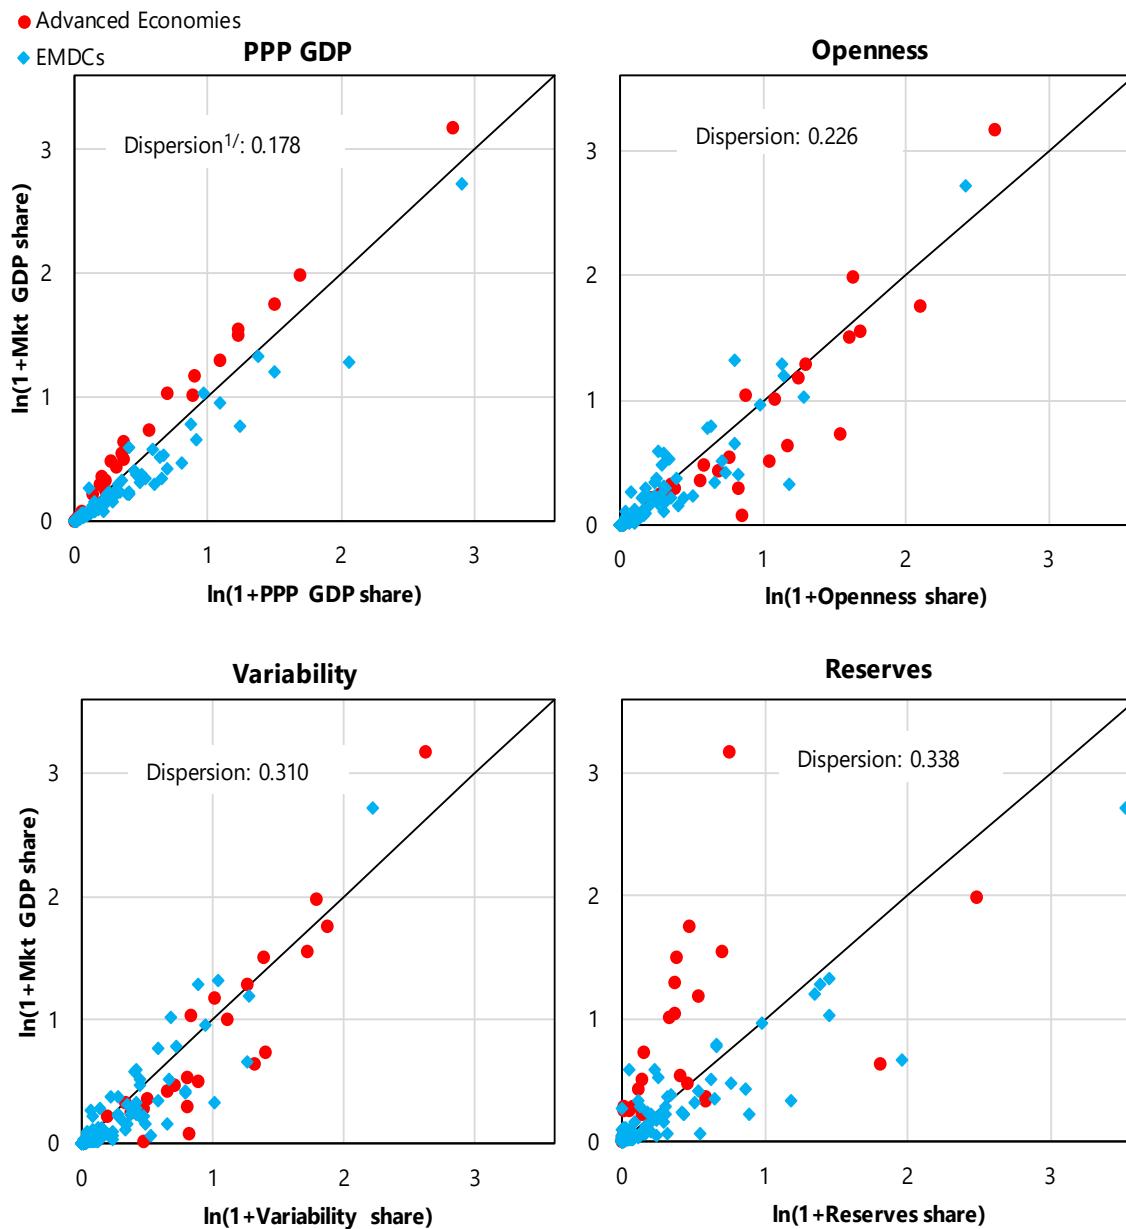

EMDCs		All Members excluding Top 10 2/			
		GDP Blend	Openness	Variability	Reserves
GDP Blend	1.00				
Openness	0.96	1.00			
Variability	0.93	0.96	1.00		
Reserves	0.96	0.95	0.93	1.00	

Source: Finance Department.

1/ Given the heterogeneity of data and differing distributions, it is possible for correlations for the full sample to fall outside of the range for the two sub samples.

2/ Large members in terms of share of GDP blend (60 percent market GDP and 40 percent PPP GDP).

Figure I.2. Relationship between Quota Variables and Market GDP share
 (2017 Data Update)

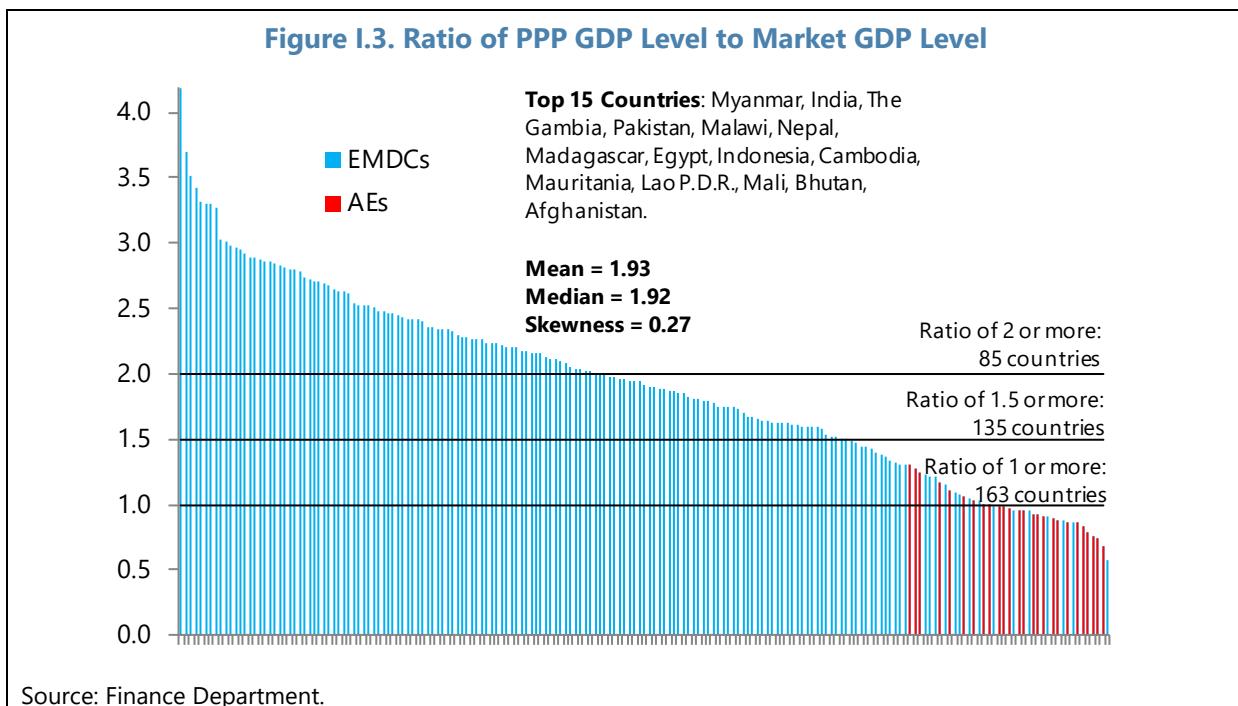

Source: Finance Department.

1/ The dispersion is given by the average of the following measure for each point: $[\text{Max } (x,y) - \text{Min } (x,y)] / [\text{Max } (x,y) + \text{Min } (x,y)]$.

B. Variables in the Quota Formula

GDP Blend

6. The current GDP variable is a blend of market GDP shares (60 percent) and PPP GDP shares (40 percent). As Figure I.3 shows, the distribution of members' ratios of nominal PPP GDP relative to market GDP shows that most EMDCs have a ratio above 1 and most AEs have a ratio below 1. The statistical measure of skewness is very low.

7. Relative to market GDP, most EMDCs and LICs benefit from PPP GDP, and the relative benefits tend to be larger for countries with lower per capita incomes. All but three countries in the bottom quartile of the income distribution benefit from a higher weight on PPP GDP relative to market GDP, and they also record, along with countries in the third quartile, the largest relative gains (see Table I.2). This pattern is to be expected, as PPP GDP seeks to capture the output of economies, and the market price of many non-tradable goods tends to be lower in countries with lower per capita incomes, reflecting in part low wage costs in services that are not tradable. There are no clear differences in terms of countries that benefit from PPP GDP when countries are grouped by size of their market GDP, except that the median ratios for the top and bottom quartiles are somewhat lower than those for the 2nd and 3rd quartiles.

8. Current PPP GDP data are based on the 2011 International Comparison Program (ICP) global estimates of purchasing power parity rates. The 2011 PPP rates are based on broader country coverage than the previous (2005) estimates and reflect also further methodological improvements. Incorporation of these estimates led to a markedly higher aggregate share of EMDCs

in global PPP GDP (58.1 percent vs. 52.8 percent on the basis of the 2005 ICP data). Consequently, the CQS of EMDCs increased by 1.0 percentage point.² The 2017 round of the ICP is proceeding as scheduled with results expected during 2019.³

Table I.2. Countries that Benefit from PPP GDP

	By Size (Market GDP) 1/				By Income (GDP per Capita) 1/				By Grouping			Total
	Top Quartile	3rd	2nd	Bottom Quartile	Top Quartile	3rd	2nd	Bottom Quartile	EMDC	excl. LIC	LIC (70)

Median 2/	1.4	1.6	1.6	1.3	1.1	1.3	1.7	1.7		1.4	1.7	1.5
Average 2/	1.6	1.6	1.6	1.5	1.2	1.4	1.7	1.8		1.5	1.7	1.6

Source: Finance Department

1/ Each quartile includes 47 countries, except the bottom quartile that includes 48 countries.

2/ Average or median ratio among the countries which have ratios greater than 1.

Openness

9. Key characteristics of the openness variable noted in previous papers include the following (Table I.3):

- **Openness benefits many smaller economies.** More than two-thirds of the membership (131 countries based on the latest data update) gain from the inclusion of openness in the formula.⁴ The number of countries that benefit from openness is inversely related to size.
- **The gains from openness are positively related to income.** Over 90 percent of countries (43 out of 47) in the top quartile in terms of per capita income gain from openness, compared with less than half (23 countries) in the bottom quartile. Among the gainers, high income countries also gain more on average than low income countries.
- **These results are also reflected in the distribution of openness shares across major country groupings** (Figure I.1 in the previous section). The main gainers from openness at the aggregate level are small advanced countries, whose openness share on average is roughly double their share in the GDP blend. Smaller EMDCs in aggregate gain modestly from openness (though some individual countries have large gains), while other country groups, including LICs as a whole, do not gain from openness.

² See [Quota Formula-Data Update and Further Considerations](#) (7/2/14).

³ The benchmark estimates for 2017 will be based on a transition to a rolling survey approach (beginning in 2017), which involves spreading the price data collection over a three-year time period around the reference year. The Technical Advisory Group (TAG) of the ICP met in May 2017 and agreed on a plan to address technical and research questions in the ICP via smaller, specialized task forces. The next ICP Governing Board meeting is scheduled for September 15, 2017 and the 4th ICP Inter-Agency Coordination Group (IACG) meeting will take place during the week of October 23-27, 2017. The IMF is represented on the IACG and the ICP Governing Board.

⁴ Consistent with past practice, a country is deemed to benefit from the inclusion of openness (or variability or reserves) if its share in this variable is larger than its share in the GDP blend variable.

Table I.3. Countries that Benefit from Openness

	By Size (Market GDP) 1/				By Income (GDP per Capita) 1/				By Grouping			Total
	Top Quartile	3rd	2nd	Bottom Quartile	Top Quartile	3rd	2nd	Bottom Quartile	EMDC AE (26)	excl. LIC (93)	LIC (70)

Source: Finance Department

1/ Each quartile includes 47 countries, except the bottom quartile that includes 48 countries.

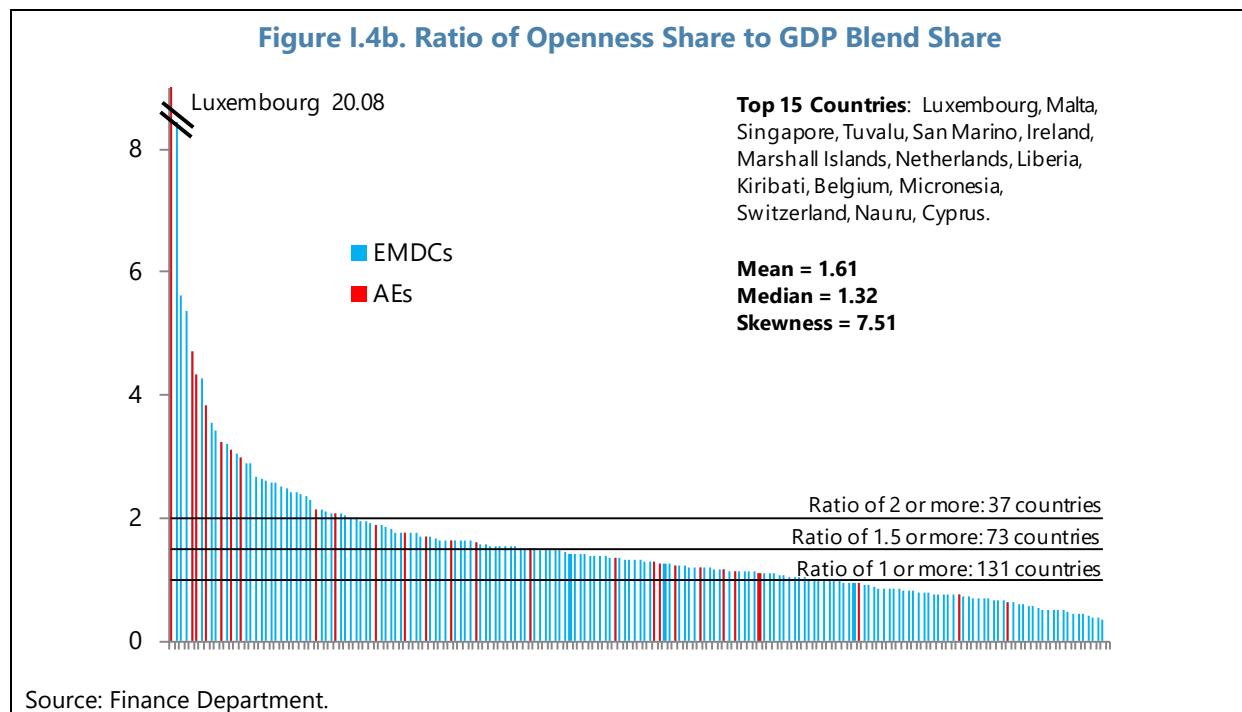

2/ Average or median ratio among the countries which have ratios greater than 1.

10. The distribution of members' shares in openness relative to GDP is highly skewed.

While the median ratio of openness to market GDP for the membership is 1.02, 13 countries have ratios greater than 2 (with the highest being above 11) and 36 have ratios above 1.5 (Figure I.4a). In terms of openness relative to GDP blend shares, roughly 60 percent of members have shares of less than 1.5. However, 37 members have a share of openness that is more than double their share in the GDP blend variable, and one member has a ratio of openness to GDP blend share above 20 (Figure I.4b). The combined effect of openness and variability, which have similar highly skewed distributions (see below) and a collective weight in the formula of 45 percent, generates very large CQS for some countries relative to their GDP shares.

Figure I.4a. Ratio of Openness Level to Market GDP Level

Source: Finance Department.

11. Concerns have been raised about the measurement of the openness variable, which is based on a gross measure that can lead to double counting of cross border flows. With possibly multiple cross border flows of goods, especially in vertically integrated production processes, a gross flow measure can result in a distorted picture of openness.⁵ Previous staff work has also highlighted the very large boost that the current openness variable provides for some countries, resulting in CQS that appear large in relation to other measures of their relative economic positions.

12. In principle, trade data on a value-added basis could be used to address the double counting problem, but severe data limitations remain in this area.⁶ First, current OECD-WTO TiVA estimates cover only about a third of the membership (63 members, or 6 more than last year) and are available only for 1995-2011 (two additional years than last year).⁷ Second, while reasonably robust estimates are available for goods exports and imports, large inconsistencies in bilateral trade in services data exist even for OECD members. The OECD-WTO uses an algorithm to approximate the allocation of bilateral services since these services account for about one quarter of total trade flows. Third, value added trade is not directly recorded by an official statistical agency (unlike other quota variables) but rather depends on input-output tables under several assumptions, including on shares of intermediate to final consumption goods at the sectoral level and on production technology for firms in each industry. The OECD applies a series of balancing procedures to reconcile the bilateral asymmetries, if data are missing. In sum, the lack of official recording of trade

⁵ See, for example, [Quota Formula—Data Update and Further Considerations](#) (6/5/13).

⁶ This topic was discussed in [Quota Formula – Data Update and Further Considerations](#) (7/2/14).

⁷ Representing OECD, EU28, G20, most East and South-East economies and a selection of South American countries.

data on a value-added basis combined with the considerable shortcomings on country coverage, quality, timeliness, prevent the use of such estimates for the purposes of the quota formula.

13. Staff has explored several options to address the issues with the current measure of openness. One approach is to maintain the current definition of openness but to modestly lower its weight in the formula. If combined with dropping variability, such an approach would significantly moderate the overall impact on CQS of the highly skewed distribution of openness (and variability). Staff has also explored the possibility of introducing a cap on the overall boost that individual countries can receive from openness. Two types of caps have been considered: one based on capping the absolute level of openness in relation to market GDP (absolute cap) and the second based on capping the ratio of openness to GDP blend shares (shares cap).⁸ Both approaches require an element of judgment in determining where to set the cap, and also add some complexity to the calculations. Table I.4 updates earlier calculations to illustrate the impact of capping openness. The thresholds are the same as in the August 2016 paper.⁹ Further work to refine the thresholds would be needed if there is interest in pursuing such an approach.

14. The view has also been expressed that intra-currency union flows should be excluded from the openness variable. Staff has explored this issue on several occasions in the past, and noted conceptual and practical issues with such an approach.¹⁰ At a conceptual level, the euro area crisis as well as balance of payments needs in CEMAC, ECCU, and WAEMU members have highlighted that balance of payments crises can also occur at the intra-currency union level. Also, potential distortions associated with cross-border flows arise whenever there is vertical integration in the production process and are not limited to currency unions, though the existence of a currency union may contribute to the growth of such flows. At a practical level, available data only cover merchandise trade and are not available on a comprehensive basis for intra-currency union services flows.¹¹ Also, except for the euro area, only very few member countries of currency unions report data on intra-currency union trade, and such an approach would not address the issue of relatively large openness shares of financial centers. With these caveats, updated estimates of the impact of excluding intra-currency union flows from the openness variable are shown in Table I.4.¹²

⁸ Staff also explored the approach of compressing the openness ratio. See [Quota Formula – Data Update and Further Considerations – Annexes](#) (6/6/13), Annex III for a detailed discussion.

⁹ In the June 2013 paper, the 1.7 cap on the ratio of the openness share to GDP blend share was equivalent to the 75th percentile of the distribution of this ratio. In the July 2014, June 2015, and August 2016 papers, the 1.8 cap was applied to maintaining the cap at a level broadly corresponding to the top quartile of the distribution based on the updated data.

¹⁰ For example, see [Quotas—Updated Calculations and Quota Variables](#) (8/27/09), [Quota Formula Review—Additional Considerations—Annexes](#) (9/4/12), and [Quota Formula Review—Data Update and Issues](#) (8/17/11).

¹¹ The data on intra-currency union trade in goods is obtained from the IMF's Direction of Trade database. These data include all trade in goods, including goods for processing gross flows, while the data underlying openness is on a BPM6 basis, including in trade flows only the processing fees (services). For the euro area countries as well as the other currency unions, no adjustment of goods for processing was made due to data constraints. Data on intra-currency union services flows are not fully available and thus no adjustments are made for these flows.

¹² Staff has presented the results of excluding intra-currency union trade as part of the annual update of additional quota variables. These updates are posted on the Fund's intranet.

1/ Shading indicates countries with capped openness shares or excluding intra currency union trade lower than their original openness shares.

2/ These correspond to the thresholds on absolute ratios of openness to market GDP of 2.22, 1.66, and 1.35 for the 95th, 85th and 75th percentile caps, respectively.

3/ Including Czech Republic, Estonia, Korea, Latvia, Lithuania, Malta, Singapore, Slovak Republic and Slovenia.

4/ Including China, P.R., Hong Kong SAR, and Macao SAR.

5/ Currently PRGT-eligible countries.

Variability

15. Variability is intended to capture members' vulnerability to balance of payments shocks and potential need for Fund resources. However, extensive staff work has failed to find any significant link between the current variable and actual or potential external vulnerabilities, or to identify a superior measure.

16. Key characteristics of variability identified previously include (Table I.5):

- **Variability tends to benefit smaller economies.** About 90 percent of the countries (43 out of 48) in the bottom quartile have variability/GDP blend shares larger than 1.
- **Countries with lower per capita incomes benefit less compared to middle and high income economies.** Only 60 percent of the countries (29 out of 48) in the bottom quartile in terms of per capita income gain from variability, compared with 70 to 85 percent of the countries in the other quartiles.
- **As with openness, these results are also reflected in the distribution of variability shares across major country groupings.** The main gainers from variability at the aggregate level are small advanced countries, whose share on average is roughly double their share in the GDP blend (Figure I.1 above). Over 70 percent of LICs and other EMDCs also gain from variability, though on average to a much lesser extent than advanced economies.

Table I.5. Countries that Benefit from Variability

	By Size (Market GDP) 1/				By Income (GDP per Capita) 1/				By Grouping			Total
	Top Quartile	3rd	2nd	Bottom Quartile	Top Quartile	3rd	2nd	Bottom Quartile	AE (26)	EMDC excl. LIC (93)	LIC (70)	
Variability / GDP Blend Shares												
Number of countries who benefit (ratio > 1)	24	33	36	43	40	34	33	29	21	66	49	136
Median 2/	1.8	1.9	2.0	2.2	2.3	1.9	1.8	2.0	2.0	1.9	2.1	2.0
Average 2/	2.1	2.8	3.5	3.0	3.9	2.2	2.4	2.9	4.7	2.3	2.9	2.9

Source: Finance Department

1/ Each quartile includes 47 countries, except the bottom quartile that includes 48 countries.

2/ Average or median ratio among the countries which have ratios greater than 1.

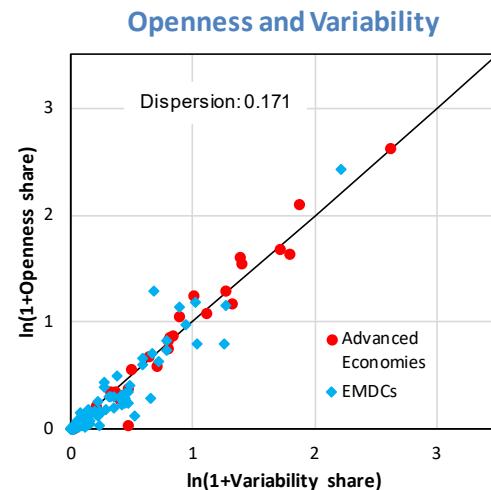

17. The distribution of members' shares in variability relative to GDP is also highly skewed. While the median ratio of variability to GDP blend for the membership as a whole is 1.64, 69 countries have ratios greater than 2 (with the highest being above 33) and 103 have ratios above 1.5 (Figure I.5).

Links between Openness and Variability

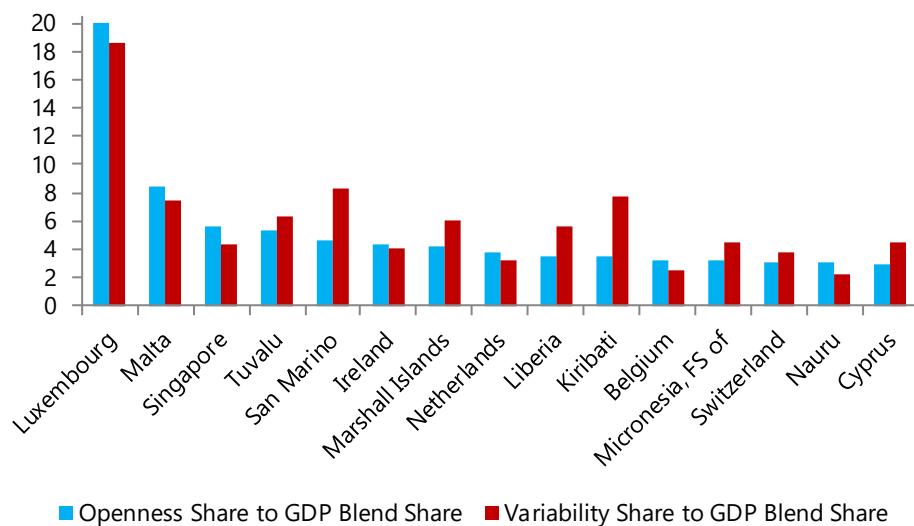

18. Both openness and variability produce similar results in terms of shares. While the specific measures differ, both variables use nominal data on the scale of external flows. In particular, openness measures the size of current payments and current receipts, whereas variability seeks to capture volatility in the level of current receipts and net capital flows. For many countries, these yield very similar results. This can be seen from several angles:

- The overall dispersion in the distribution of openness and variability shares is low, e.g., slightly below that between market and PPP GDP and significantly below that between other quota variables and market GDP (see Text Figure and Figure I.2 in Section A).
- The distribution of openness and variability shares among the main country groups is almost identical (Figure I.1 in Section A).
- As noted, once the largest economies are excluded (their weight tends to dominate the comparisons of size-related variables), the correlation between openness and variability is 0.98, well above that between other variables (Table I.1).

- The distribution of gainers from variability is broadly similar to that for openness, in terms of both size and income levels, as well as across the major country groupings as shown above (Tables I.3 and I.5). Small advanced countries gain the most from variability, benefiting almost as much as from openness. Smaller EMDCs and LICs also gain from variability relative to GDP, but the gains are more modest.
- At the individual country level, the countries that gain the most from openness also have relatively high shares in variability (Figure I.6).
- A purely illustrative calculation, showing the impact of dropping variability and moving all of its weight to openness, indicates that the distribution of CQS would be broadly unchanged across the largest individual countries and major country groups (Table I.6).

2/ Including China, P.R., Hong Kong SAR and Macao SAR.

3/ Currently PRGT-eligible countries.

Reserves

19. Some key characteristics of the impact of reserves include (Table I.7):

- **Reserves benefit many smaller economies.** About two thirds of the countries (32 out of 48) in the bottom quartile have reserves/GDP blend shares larger than 1, compared with about 40 percent for the other 3 quartiles.
- **Low per capita income countries benefit less compared to middle and high income economies.** Only one-fourth of the countries (12 out of 48) in the bottom quartile in terms of per capita income gain from reserves, compared with more than 50 percent of the countries (29 and 28 out of 47) in the second and third quartiles.
- **In relative terms, EMDCs (excluding LICs) are the main gainers from reserves,** with over half of the countries in this group benefiting. Roughly 44 percent of LICs benefit from reserves, and only 27 percent of AEs.

Table I.7. Countries that Benefit from Reserves

	By Size (Market GDP) 1/				By Income (GDP per Capita) 1/				By Grouping			Total
	Top Quartile	3rd	2nd	Bottom Quartile	Top Quartile	3rd	2nd	Bottom Quartile	AE (26)	EMDC excl. LIC (93)	LIC (70)	
<i>Reserves / GDP Blend Shares</i>												
Number of countries who benefit (ratio >1)	17	21	18	32	19	29	28	12	7	50	31	88
Median 2/	1.9	1.8	1.4	1.6	1.9	1.7	1.4	1.5	2.2	1.7	1.5	1.6
Average 2/	2.4	2.4	1.6	2.6	2.4	2.1	2.0	3.4	2.7	2.1	2.6	2.3

1/ Each quartile includes 47 countries, except the bottom quartile that includes 48 countries.

2/ Average or median ratio among the countries which have ratios greater than 1.

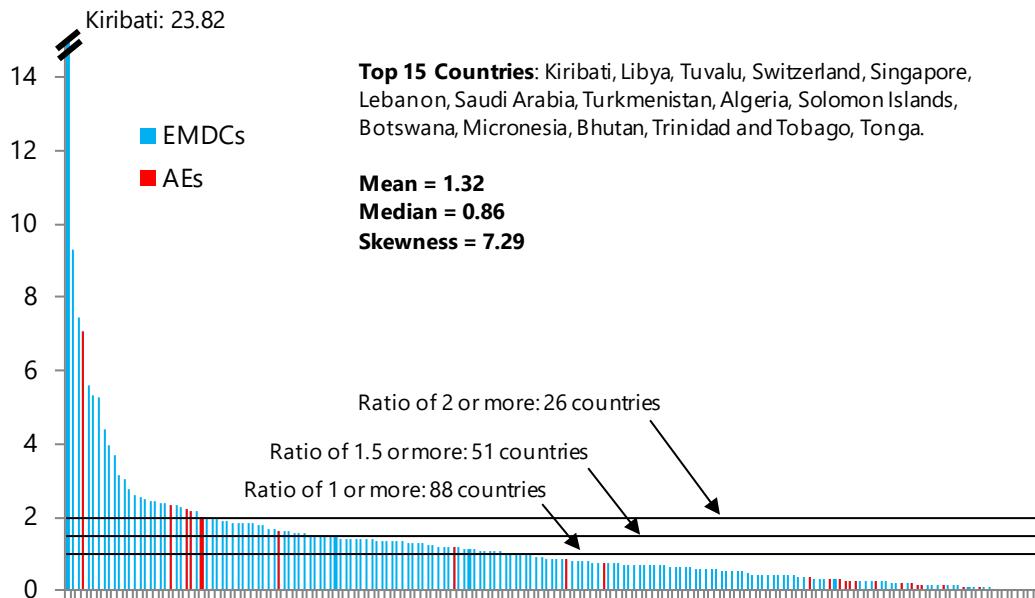

20. The distribution of members' reserves relative to GDP is quite skewed (Figures I.7a and I.7b). In terms of shares, 26 members have reserves shares more than double their shares in GDP blend (the highest ratio is almost 24 times) and 51 members have ratios greater than 1.5. Based on the latest data, 88 members benefit to some extent from the inclusion of reserves in the formula.

Figure I.7a. Ratio of Reserves Level to Market GDP Level

Source: Finance Department.

Figure I.7b. Ratio of Reserves Share to Blend GDP Share

Source: Finance Department.

Compression factor

21. The characteristics of the compression factor are summarized below (Table I.8):

- **The compression factor benefits all but the largest economies.** The CQS of the largest 8 members (based on the uncompressed formula and using the current quota database) are reduced, while the CQS of all other members are increased. In total, compared with a linear combination of the quota formula variables, the compression factor shifts approximately 3 percentage points of shares from the 8 largest members to the remaining 181 members. The original ranking of countries is unchanged with compression.
- **As a group, low income countries benefit more compared to high income economies.** While the compression factor is unrelated to income, almost all countries in the bottom two quartiles in terms of per capita income gain from its inclusion.
- **In terms of major country groups, EMDCs and LICs are the main gainers.** All LICs benefit as do all but three EMDCs. Twenty-one out of 26 AEs also benefit from compression.

Table I.8. Countries that Benefit from Compression

	By Size (Market GDP) 1/				By Income (GDP per Capita) 1/				By Grouping			Total	
	Top Quartile	3rd	2nd	Bottom Quartile	Top Quartile	3rd	2nd	Bottom Quartile	EMDC	excl. LIC	LIC (70) (93)		
<i>CQS / uncompressed linear combination</i>													
Number of countries who benefit (ratio >1)	39	47	47	48	42	45	47	47	21	90	70	181	
Median 2/	1.1	1.2	1.2	1.4	1.1	1.2	1.3	1.3	1.1	1.2	1.3	1.2	
Average 2/	1.1	1.2	1.2	1.4	1.1	1.2	1.3	1.3	1.1	1.2	1.3	1.2	

Source: Finance Department.

1/ Each quartile includes 47 countries, except the bottom quartile that includes 48 countries.

2/ Average or median ratio among the countries which have ratios greater than 1.

22. The benefits of compression are inversely related to country size. As noted, the eight largest countries lose from compression while the rest of the membership benefits. The median ratio of CQS (i.e., including compression) to uncompressed calculated quota share for the membership is 1.20, and 4 countries have ratios greater than 1.5. (Figure I.8). As the figure shows, the lower share of the eight largest countries after including the compression factor enables the allocation of a larger share for the rest of the 181 countries (ratio of CQS to uncompressed linear combination > 1).

Annex II. Illustrative Formula Simulations

This annex presents updated results of previous illustrative simulations of possible reforms of the quota formula, as summarized in Table 1 of the main paper. The Annex covers the results for the 35 members with the largest quotas and for major country groups. Results for all individual member countries are presented in Supplement 2, Statistical Appendix.

1. The illustrative simulations presented in this annex cover four broad sets of reforms, as described in the main text:

- Set 1: Simplification of the current formula – dropping variability, keeping current GDP and openness measures (Table II.1).
- Set 2: same as Set 1, but with different combinations of GDP blend (Tables II.2-II.5).
- Set 3: same as Set 1 but with different openness measures (Tables II.6-II.8)
- Set 4: same as set 1, but with a higher and a lower degree of compression (Tables II.9-II.10).

Table II.1. Illustrative Calculations—Current GDP and Openness Measures, and Dropping Variability
(In percent)

Annex III. Additional Illustrative Formula Simulations

This annex provides additional information on a technical exercise discussed in the main paper to simulate possible reforms in the quota formula that would be required to generate outcomes near the midpoint of the range of views on the formula that have been expressed so far.

- 1. As discussed in the main paper, a range of views on the formula have been expressed in the discussions so far.** One broad view is that the current formula is broadly adequate and does not need major reforms. Another broad view is that economic size is the only relevant indicator of members' relative positions in the global economy and that the quota formula should be reduced to a single variable—GDP (and without compression). There is also a spectrum of views between these positions.
- 2. These two views imply different results in terms of the distribution of calculated quota shares (CQS).** The implied distributions are broadly the same at the aggregate level in terms of the total CQS of AEs and EMDCs. However, they are significantly different at the level of individual countries.
- 3. Staff has conducted a technical exercise to identify the types of reforms that could be required to generate CQS near the midpoint of the distributions implied by these two broad views.** First, the midpoint is calculated for each member as the simple average of CQS implied by the current formula and an alternative formula based solely on the GDP blend. Second, several variants are explored to identify formulas that most closely approximate the midpoint. In each case, the permissible range for the underlying parameters was established upfront, and then all alternative combinations within that range were explored to find the best fit with the midpoint. Three sets of parameters were explored, as described in Table III.1. The first set is based on the range of reforms considered in this and previous quota data update papers (see Annex II). The second and third sets involve a substantial relaxation of the restrictions on these parameters to allow exploration of a much broader range of reforms.

Table III.1. Parameters for Alternative Formulas—Midpoint Approach

Restriction set	Weights (in percent) 1/					Compression factor
	Market/PPP blend	GDP	Openness 2/	Variability	Reserves	
A. Previous formula simulations	50/50 to 65/35	57.5, 60, 65 or 70	37.5, 35, 30 or 25	dropped	5	0.925, 0.950 or 0.975
B. Wider range for GDP, openness, blend and compression	0/100 to 100/0	0 to 95	0 to 95			0.900, 0.925, 0.950, 0.975 or 1.000
C. Allowing reserves to vary		0 to 100	0 to 100		0 to 10	

1/ When not explicit, variable weights change in 2.5 pp increments. GDP blend changes in 5 pp increments.

2/ All sets allow alternative definitions of openness: absolute caps (85th and 75th percentiles) and shares caps (1.8 and 1.5 ratio). Sets B and C also include openness excluding intra currency union flows.

4. Within each set, illustrative quota formulas were identified that minimize the absolute distance to the midpoint. For each formula specification, this measure of best fit is calculated as the sum of absolute differences between the quota shares produced by the formula and the quota shares from the midpoint. The results are purely mechanical and do not involve any further judgment about the relative merits of alternative combinations after the initial parameters have been established.

5. For each set, the results for the five quota formulas that provide the closest fit with the midpoint are shown in Tables III.2a-2c. For example, in Set A, which is the most restrictive, the formula with the best fit is one that includes a 70 percent weight for the current GDP blend measure, 25 percent weight for openness (uncapped), 5 percent for reserves, and less (0.975) compression than in the current formula. The absolute distance from the midpoint for this best fit formula of Set A is 3.31 pp. Loosening the restrictions improves the goodness of fit, to 2.49 pp for Set B and 1.84 pp for Set C for the formulas that generate the best fit in each respective set.

Table III.2a. Illustrative formulas – Set A (Previous Formula Simulations)

Rank	Formula specification							Total absolute distance from midpoint (pp)
	Blend	GDP	Openness		Variability	Reserves	Compression	
			Weight	Definition				
1	60/40	70.0	25.0	Normal	0.0	5.0	0.975	3.31
2	65/35	70.0	25.0	Normal	0.0	5.0	0.975	3.49
3	55/45	70.0	25.0	Normal	0.0	5.0	0.975	3.57
4	60/40	70.0	25.0	Absolute (85%)	0.0	5.0	0.975	3.80
5	65/35	70.0	25.0	Absolute (85%)	0.0	5.0	0.975	4.08

**Table III.2b. Illustrative Formulas – Set B
(Wider Range for GDP, Openness, Blend and Compression)**

Rank	Formula specification							Total absolute distance from midpoint (pp)
	Blend	GDP	Openness		Variability	Reserves	Compression	
			Weight	Definition				
1	65/35	75.0	20.0	Normal	0.0	5.0	0.975	2.49
2	60/40	75.0	20.0	Normal	0.0	5.0	0.975	2.62
3	65/35	77.5	17.5	Normal	0.0	5.0	0.975	2.63
4	70/30	77.5	17.5	Normal	0.0	5.0	0.950	2.71
5	65/35	77.5	17.5	Normal	0.0	5.0	0.950	2.74

Table III.2c. Illustrative Formulas – Set C (Allowing Reserves to Vary)

Rank	Formula specification							Total absolute distance from midpoint (pp)
	Blend	GDP	Openness		Variability	Reserves	Compression	
			Weight	Definition				
1	60/40	77.5	20.0	Normal	0.0	2.5	0.975	1.84
2	60/40	75.0	22.5	Normal	0.0	2.5	0.975	1.88
3	65/35	75.0	22.5	Normal	0.0	2.5	0.975	2.31
4	65/35	77.5	20.0	Normal	0.0	2.5	0.975	2.32
5	60/40	72.5	25.0	Normal	0.0	2.5	0.975	2.42

6. Overall, the midpoint calculations tend to produce formulas with a higher weight for GDP, less compression, and the current measure of openness. In each set, all top-five formulas that minimize the distance to the midpoint involve a weight for GDP of at least 70 percent, and 72.5–77.5 percent in Sets B and C where the restrictions are relaxed. There is some fluctuation in the composition of the GDP blend, but it remains broadly around the current 60/40 mix of market and PPP GDP. In most formulas, the compression factor is increased to 0.975 (resulting in a lower degree of compression). In all sets, the weight of openness is reduced, ranging from 17.5 to 25 percent. Alternative specifications of openness feature only in some of the top-five formulas for Set A (with absolute cap at the 85th percentile). When the weight of reserves is allowed to vary (Set C), the weight of this variable is reduced to 2.5 percent in the formulas that yield the best fit.¹

7. Reducing the restrictions in the sets of formulas reduces substantially the distance between calculated quota shares and the midpoint for some individual members. Table III.3 shows the largest individual deviations relative to the midpoint for the formulas with best fit in each set (by member results for each formula are found in Supplement 2, Statistical Appendix). In Set A, the imposed restrictions cause sizable deviations from the midpoint for a few members, e.g., the US (0.7 pp below the midpoint), China (0.4 pp above), and Korea (0.2 pp above). The relaxation of restrictions on GDP and openness in Set B improves the overall fit, with China recording the largest deviation from its calculated midpoint (0.6 pp above) and all other deviations below 0.2 pp. By allowing reserves to vary from zero to 10 percent in Set C, the gap for China is reduced (to 0.2 pp), and all other deviations are at most 0.1 pp.

Table III.3. Largest Individual Deviations from the Midpoint (In percentage points)

	Rank	Set A Formula	Set B Formula	Set C Formula	
Above midpoint	1	China	0.41	China	0.55
	2	Korea, Republic of	0.19	Japan	0.18
	3	Singapore	0.14	Korea, Republic of	0.15
	4	Germany	0.13	Switzerland	0.06
	5	Switzerland	0.12	Canada	0.05
Below midpoint	5	India	-0.04	Russia	-0.05
	4	Ukraine	-0.05	Iceland	-0.05
	3	Iceland	-0.05	Ukraine	-0.06
	2	Brazil	-0.07	India	-0.08
	1	United States	-0.73	United States	-0.14
				Saudi Arabia	-0.09

¹ All these simulations assume that variability is dropped. Staff also explored a set of simulations where variability is permitted to remain in the formula with a weight up to its current weight of 15 percent. In this set, the best fit was obtained with the following specification: $(0.75 \cdot \text{GDP} + 0.15 \cdot \text{Openness} + 0.075 \cdot \text{Variability} + 0.025 \cdot \text{Reserves})^{0.975}$, with a 60/40 blend of market and PPP GDP and uncapped openness. It restores variability at a smaller weight (7.5 percent), mostly coming from a reduction in the weight of openness. In other words, variability would enter with a small weight while the weight of openness would be further reduced. In this case, the coefficients are exactly the average of the coefficients of the current formula and a GDP-blend only formula, reflecting the nature of the midpoint distribution used in this exercise.

Annex IV. Protection of the Poorest Members

Board of Governors Resolution No. 66-2 on the 14th Review stated that steps shall be taken to protect the voice and representation of the poorest members under the 15th Review. The commitment to protect the voice and representation of the poorest members was reiterated in the Executive Board's report on the outcome of the 2013 quota formula review and subsequent guidance by the IMFC and the Board of Governors.¹ Accordingly, it will be necessary to define how such protection would be provided and the definition of members who would qualify for protection. This annex discusses some options and presents illustrative results of their implications for the "cost of protection".

1. In the 14th Review, the definition of the poorest Fund members was based on PRGT-eligibility and per capita GNI. Specifically, the poorest members were defined as PRGT-eligible countries with annual per capita GNI below the prevailing operational IDA cut-off in 2008 (US\$1,135) or below twice the IDA's cut-off for countries meeting the definition of a "small country" under the PRGT eligibility criteria. The countries covered included 52 members plus Zimbabwe, which was not PRGT-eligible at the time due to arrears. South Sudan, which joined the Fund subsequently, also met this criterion and was protected through the 14th Review quota increase included in its membership resolution. The combined post-14th Review quota share² for these 54 countries is 3.3 percent.

2. Other options for defining the poorest members were also discussed at the time. These included the full list of PRGT-eligible countries, as well as the list of low income countries as defined in the IBRD's World Development Indicators with an annual per capita GNI of US\$975 or less. However, the definition described in the previous paragraph was seen as the preferred approach. It was also decided that protection should be provided through ad hoc quota increases at the individual country level for the eligible countries in the group rather than for the group as a whole.

3. Using the same approach as under the 14th Review, and the updated IDA income cut-off of US\$1,185, the current list of the poorest members would include 37 countries.³ The FY 2017 IDA per capita GNI threshold is based on calendar year data for 2015. The reduction in the number of qualifying members reflects the fact that the IDA cut-off has been increased relatively modestly in U.S. dollar terms since the 14th Review, while many of the poorest countries have

¹ See, e.g., the *Board of Governors Resolution No. 72-1 on the Fifteenth General Review of Quotas* (12/5/16) and the [Communiqué of the Thirty-Fifth Meeting of the IMFC](#), April 22, 2017, Washington, D.C.

² In this paper, post-14th Review quota shares are calculated assuming that all members have paid for quota increases under the 14th Review. As of June 30, 2017, only eight members have not paid for their quota increases. Marshall Islands, Palau, and Papua New Guinea have consented to, but not yet paid for their quota increases. Eritrea, Micronesia, Somalia, Sudan, and Syria have not consented to their quota increases under the 14th Review. Somalia and Sudan are currently not eligible to consent to their quota increases under the 11th and 14th General Reviews due to protracted arrears to the Fund in the General Resources Account.

³ The IDA per capita GNI threshold is reviewed annually, every July. The threshold was set at US\$1,215 for both FY 2015 (July 1, 2014 – June 30, 2015) and FY 2016 (July 1, 2015 – June 30, 2016). The IDA threshold for FY 2017 (July 1, 2016 – June 30, 2017) was reduced to US\$ 1,185, mainly reflecting the strong appreciation of the US dollar. The IDA income threshold for FY 2018, based on 2016 GNI, is US\$ 1,165. In order to maintain consistency with the 2015 data cut-off used in this paper, the FY 2017 threshold is used for the update of the poorest members list.

enjoyed relatively strong income growth. The combined post-14th Review quota shares for these 37 countries is 1.7 percent. This definition is used for protecting the quota shares of the poorest members in all illustrative allocation simulations presented in the main paper.

4. In addition to the approach followed under the 14th Review, other options could also be considered for the list of poorest countries eligible for protection in the 15th Review. These include the full list of PRGT-eligible countries, as well as alternatives such as United Nations list of least developed countries and the WEO's low income developing countries (see Table IV.1).

All PRGT-Eligible Countries

5. There are currently 70 PRGT-eligible countries. The PRGT eligibility is reviewed every two years, with the latest review in May 2017.⁴ The combined AQS for the 70 currently PRGT-eligible countries is 3.3 percent, which is almost identical to the combined AQS of countries in the original 14th Review list, even though the latter included a significantly lower number of countries. This reflects the graduation of Vietnam from the PRGT eligibility in 2015. Vietnam was protected under the 14th Review and had a relatively large quota share.

The United Nations list of least developed countries (LDCs)

6. This list includes 47 low-income countries confronting severe structural impediments to sustainable development. The list of LDCs is reviewed every three years and is based on three criteria: Gross National Income (GNI) per capita,⁵ the human asset index (HAI),⁶ and the economic vulnerability index (EVI).⁷ Both HAI and EVI are composed of several indicators. The combined AQS for the UN LDCs is 2.4 percent. The UN list includes Angola, which is neither PRGT-eligible nor included in the WEO LIDC list (see below). Equatorial Guinea, which was in a similar situation, dropped out of the list in 2017, following a scheduled graduation.

The WEO's Low Income Developing Countries (LIDCs)

7. This group was introduced in 2014 and currently includes 60 countries, of which 43 were protected under the 14th Review.⁸ LIDCs are currently defined as countries that (i) were designated PRGT-eligible in the 2013 PRGT eligibility review, and (ii) had a level of per capita GNI less than the PRGT income graduation threshold for non-small states (that is, twice the IDA

⁴ For more details, please refer to [Eligibility to Use the Fund's Facilities for Concessional Financing for 2017](#) (4/13/17).

⁵ The threshold for inclusion is based on a three-year average of the level of GNI per capita, and is the same which the World Bank uses for identifying low-income countries. The 2015 Triennial Review set the GNI per capita threshold at US\$1,035 for three years.

⁶ The HAI is a measure of the level of human capital, and consists of four indicators, two on health and nutrition (percentage of population undernourished, and mortality rate for children aged five years or under) and two on education (gross secondary school enrolment ratio, and the adult literacy rate).

⁷ The EVI measures the structural vulnerability of countries to exogenous economic and environmental shocks and contains, five of which are grouped into an exposure index and three into a shock index.

⁸ Staff plans to present an update of the WEO LIDC list in the October 2017 World Economic Outlook.

operational threshold, or US\$2,390 in 2011 as measured by the World Bank's Atlas method), and also Zimbabwe. As the current LIDC list is based on 2013 PRGT eligibility, it still includes Bolivia, Mongolia, Nigeria, and Vietnam, which have graduated from PRGT eligibility in 2015. The combined AQS for the 60 WEO LIDCs is 4.0 percent (if the four countries that are no longer PRGT-eligible are excluded, this number drops to 3.2 percent).

Cost of Protection

8. Alternative definitions for the poorest members eligible for protection would have different implications in terms of the potential “cost of protection”. In the past, the “cost of protection” has been defined as the share of the total quota increase that is allocated in an ad hoc manner to protect the eligible members in the list of poorest countries against a decline in their quota shares. The cost of protection depends on a number of factors, among which are:

- actual and calculated quota shares of the eligible countries to be protected,
- the overall size of the quota increase, and
- the allocation method for the quota increase.

9. Simulations similar to the ones used in the main paper suggest that the costs of protection are likely to be relatively small in aggregate. Table IV.2 summarizes the cost of protection for the four types of allocation used in the main paper⁹, using all five groups of poorest countries discussed in this Annex. For these simulations, the cost of protection is independent from the size of increase.¹⁰ In all cases the share of quota increases that would have to be allotted for protection is less than 1.5 percent. The full list of PRGT-eligible countries has the highest cost of protection, followed fairly closely by the WEO LIDC list, with costs similar to the 14th Review list. The updated IDA cut-off list gives the lowest costs of protection.

⁹ This comprises three selective allocations (based on the current formula, formula 1.2 and midpoint set C) and one combination of selective and small ad hoc proportional to voluntary financial contributions (based on formula 1.2 and VFCS II, respectively).

¹⁰ This reflects the fact that the part of the increase used for protection comes from a reduction in the selective component of the increase and, for the simulation with financial contributions, the size of the ad hoc component is a fixed share of the total increase.

1/ Effective May 31, 2017.

2/ Countries that were PRGT-eligible and met the IDA per capita GNI cut-off of US\$1,135 in 2008 (or twice that amount for small states, as defined by the IMF), plus Zimbabwe.

3/ Countries that are PRGT-eligible and meet the FY 2017 IDA per capita GNI cut-off of US\$1,185 (data through 2015) or twice that amount for small states, as defined by the IMF.

10. Broadening protection provides substantial gains for several countries as they become eligible for protection, with small changes for the remaining members. To illustrate the impact both on countries that are potentially eligible for protection and on the rest of the membership, Tables IV.3 and IV.4 compare the resulting quota shares for an illustrative allocation considering the costliest scenario (125 percent increase, based on Midpoint Set C formula) for moving from the narrower updated IDA cut-off list (comprising 37 countries) to the broader PRGT-eligible list (comprising 70 countries). Table IV.3 shows the outcome of broadening the protection list for the 35 largest countries (none of which are eligible for protection) and the main country groups. The largest decline in quota shares for an individual country is 0.06 pp and the relative decline for all members not eligible for protection is around 0.3 to 0.4 percent of their respective quotas. Table IV.4 shows the impact of the change on the group of PRGT-eligible countries. For 32 countries that were already effectively protected under the narrower list, there is no change in quota shares, as their actual quota shares are again protected and will remain unchanged. However, for 29 countries which become eligible for protection, gains are sizable—their quota share increases are on average above 40 percent (or the average prevented fall in their quota shares is around 30 percent).¹

**Table IV.2. Cost of Protection – Share of Total Quota Increase Allotted for Protection
(in percent)**

Allocation	PRGT-eligible countries 1/	14th Review List 2/	Updated IDA Cut-Off List 3/	United Nations List	WEO LIDC List

Annex V. Voluntary Financial Contributions

This Annex updates staff estimates of members' voluntary financial contributions (VFCS) to the Fund. The calculations cover the main forms of voluntary financial contributions, including bilateral and multilateral loans to the General Resources Account (GRA), loan contributions to the Poverty Reduction and Growth Trust (PRGT) and its predecessors, subsidy contributions to concessional financing, and financing for capacity development (i.e., technical assistance and training). Building on staff's earlier work, it also illustrates alternative forms of aggregating such diverse contributions, recognizing the difficulties involved.

Background

1. Options for recognizing financial contributions were discussed extensively during the QFR.¹

Directors recognized the importance of financial contributions to the Fund. Much of the discussion focused on whether to include a measure of financial contributions in the quota formula, and different views were expressed on this issue. One view was that voluntary financial contributions should be included in the quota formula (either instead of, or as a complement to, reserves) as it would help incentivize the provision of such contributions to the Fund. Another view was that such inclusion was inconsistent with the Fund's role as a quota-based institution. Following an extensive debate, the Executive Board's QFR report to the Board of Governors noted that: "*Views diverged on the merits of such an approach. It was agreed to consider whether and how to take into account very significant voluntary financial contributions through ad hoc adjustments as part of the 15th Review.*"²

2. Differences in views remain regarding whether and, if so, how to recognize voluntary financial contributions in the context of the 15th Review.

Directors have discussed the issue of voluntary financial contributions repeatedly since the QFR, including in the context of 2016 quota data update.³ As reflected in the Executive Board's Report to the Board of Governors on progress on the Fifteenth Review of Quotas in September 2016, "[d]ifferences also remain, *inter alia*, over whether and, if so, how to recognize members' voluntary financial contributions in quota adjustments."⁴ The timetable set forth in the Executive Board's Report to the Board of Governors in November 2016 envisages that the issue of whether and, if so, how to recognize voluntary financial contributions will be discussed as part of the work during the second half of 2017 and early 2018.⁵

¹ See [Quota Formula Review—Initial Considerations](#) (2/10/12), [Quota Formula Review—Data Update and Further Considerations](#) (6/28/12), and [Quota Formula Review—Additional Considerations](#) (9/4/12), and [Quota Formula Review—Further Considerations](#) (11/8/12). See also the summary of the Executive Board Meetings that discussed these papers in [PIN 12/35](#), [PIN/12/94](#), [PIN12/120](#) and [PIN 12/145](#), respectively.

² See [Outcome of the Quota Formula Review—Draft Report of the Executive Board to the Board of Governors](#) (1/30/13).

³ [Quotas—Data Update and Simulations](#) (8/9/16) provided background for this discussion.

⁴ See [Report of the Executive Board to the Board of Governors on Progress on the Fifteenth General Review of Quotas](#) (9/30/16).

⁵ See [Fifteenth General Review of Quotas—Report to the Board of Governors](#) (11/2/16).

3. Staff has updated earlier estimates of members' voluntary financial contributions to the Fund. In light of the outcome of the QFR and subsequent Board discussions, the annex focuses solely on voluntary financial contributions to the Fund. For example, members' participation in the Financial Transactions Plan is not covered here as this is an obligation of membership that meet the relevant criteria. Similarly, the estimates include only financial contributions and do not attempt to capture members' in-kind contributions or financing provided by members bilaterally to other members in the context of the Fund's financial arrangements.

4. The voluntary financial contributions considered in this annex include a broad range of contributions. They cover bilateral borrowing agreements with the Fund, multilateral support for Fund liquidity in the GRA through the New Arrangements to Borrow (NAB),⁶ loan contributions to the PRGT (and its predecessors), subsidy contributions for concessional financing, and capacity development (CD). As discussed below, there are multiple ways of aggregating these different forms of financial contributions.

5. The diversity of forms of voluntary financial contributions raises a number of issues when it comes to defining and constructing an aggregate measure. These include:

- The need to determine the relevant time frame for considering contributions;
- How to combine contributions that differ substantially both in magnitude and in form, with some contributions involving budget outlays and others involving the temporary provision of loans; and
- How to aggregate diverse contributions over time.

While recognizing the challenges related to timing of voluntary contributions and comparability of different types of contributions, this Annex uses the approach presented in previous staff work, where contributions are measured mainly on a commitment basis, reflecting the amounts that members stand ready to (have pledged to) provide to the Fund regardless of the amounts that are actually drawn.

Update of the Three Aggregate Measures of VFCs

6. The Annex updates the three aggregate measures of voluntary financial contributions presented in [Quotas—Data Update and Simulations \(8/9/16\)](#). These measures are defined as follows:⁷

⁶ The GAB is not included in the illustrative aggregate measures of voluntary financial contributions because it does not add to the Fund's overall lending envelope, as outstanding drawings and available commitments under the NAB and the GAB may not exceed the total amount of NAB credit arrangements.

⁷ See Box V.1 for more details, and Table V.1 for a summary of selected indicators of members' financial contributions to the Fund. Table V.2 provides a summary of the distribution across broad country groups of these three aggregate measures of voluntary financial contributions.

- **VFCS I** – the simple average of member contribution shares to the following five voluntary financial contributions: i) NAB, ii) 2012 and 2016 bilateral borrowing agreements as of end-April 2017,⁸ iii) PRGT loans, iv) subsidies for concessional financing, and v) capacity development.
- **VFCS II** – same contributions as in VFCS I, but with fixed weights for the main forms of contributions. Specifically, VFCS II is a weighted average of member contributions to the NAB (0.3), effective 2012 and 2016 bilateral borrowing agreements as of end-April 2017 (0.3), PRGT loans and subsidies for concessional financing combined (0.2), and capacity development (0.2). The higher weight on NAB/bilateral resources would reflect to some extent the large magnitude of resources provided compared to contributions to concessional financing and capacity development.
- **VFCS III** – same contributions as in VFCS I, but using the higher of the 14th Review quota share or VFCS I share rebased to ensure that total shares add up to 100 percent. This metric recognizes members that have provided financial contributions in excess of their respective quota shares. One implication of this approach, however, is that members that have contributed, but less than their 14th Review quota shares, are treated the same as other members that have not contributed.

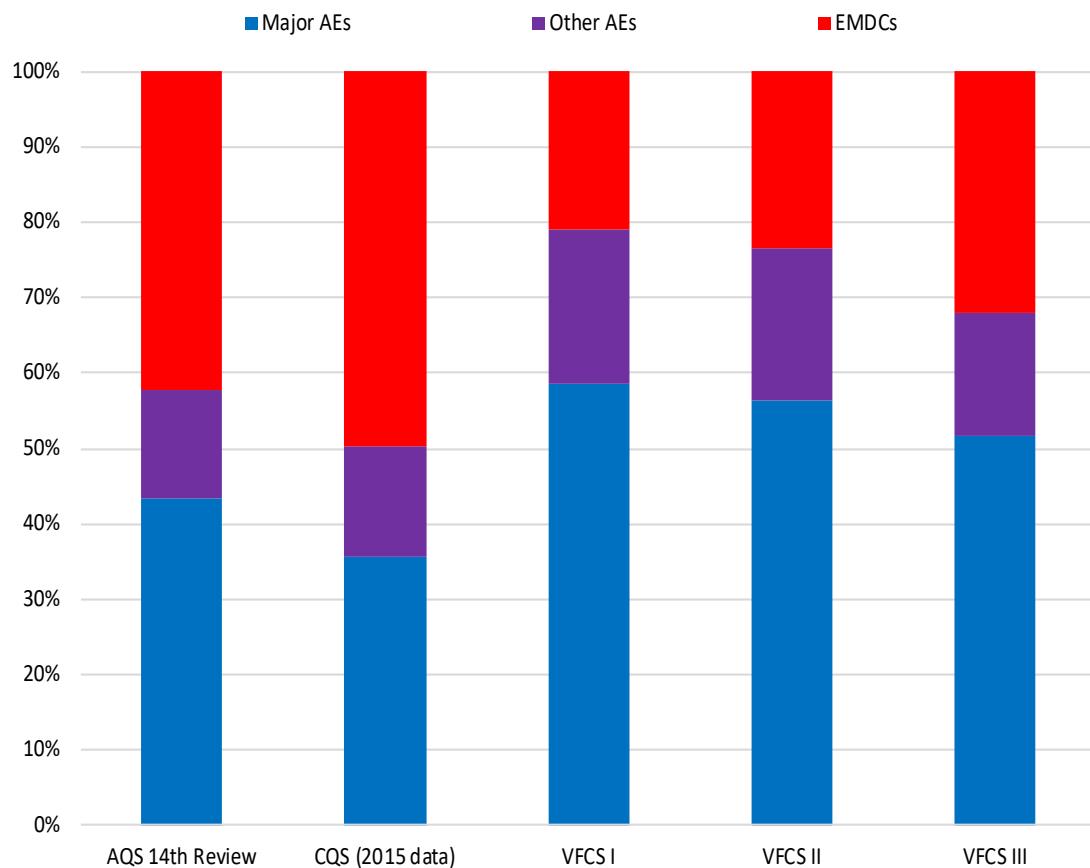

7. Based on all three measures, AEs account for a much larger share of voluntary financial contributions than their 14th Review AQS or current CQS (see Figure V.1). The share of AEs is the highest (almost 80 percent) for VFS I, i.e., the measure that averages contributions shares across all five forms. On the other hand, VFCS III results in a smaller share of AEs, as it also recognizes a member's quota share. There are also significant differences across individual member countries, both within the group of AEs and among EMDCs.

8. The main paper illustrates one possible approach to recognizing voluntary financial contributions through ad hoc adjustments as part of the 15th Review (Table 9). These calculations use the measure VFCS II above, and allocate 5 percent of the overall quota increase to be distributed based on shares in this measure. As discussed in previous staff papers, there are many possible ways of measuring such contributions and staff could conduct further work on this topic based on Directors' guidance.⁹

⁸ These include effective 2012 and 2016 bilateral borrowing agreements, approved 2016 bilateral borrowing agreements expected to become effective shortly, and pledges to the 2016 borrowing agreements by members whose agreements were at advanced stages under their domestic processes as of end-April 2017.

⁹ See [Fourteenth General Review of Quotas – Realigning Quota Shares – Further Considerations – Simulation Requests](#) (8/27/10).

Figure V.1. Financial Contributions: Distribution of Aggregate Measures by Major Country Groupings

Source: Finance Department

Box V.1. Components of Voluntary Financial Contributions Shares

Aggregate measures of Voluntary Financial Contributions by member countries comprise five key components:

- All credit arrangements under the New Arrangements to Borrow (NAB) that were effective as of end-April 2017.
- All effective 2012 and 2016 bilateral borrowing agreements with the Fund, approved 2016 bilateral borrowing agreements expected to become effective shortly, and pledges to the 2016 borrowing agreements by members whose agreements were at advanced stages under their domestic processes as of end-April 2017.
- All loan commitments by member countries to the PRG Trust (and its predecessors) cumulative from 1988 to end-April 2017.
- Cumulative subsidy contribution (as of end-April 2017) to various concessional financing initiatives, including^{1/}:
 - (i) the PRGF-ESF Trust^{2/} (1987);
 - (ii) the PRG-HIPC Trust^{3/} (1999);
 - (iii) the MDRI^{4/} and ESF (2005);
 - (iv) the PRGT Subsidy Account (2009); and
 - (v) the CCRT^{5/} (2015); as well as
 - (vi) the distribution in 2012/13 of windfall profits from the sale of gold in 2009/10 to the PRGT Subsidy Account.
- Net disbursements for capacity development (technical assistance and training) over the period FY1999–FY2017.

1/ Years refer to start of new fundraising round (in some cases multi-year) approved by the Executive Board.

2/ Poverty Reduction and Growth Facility and Exogenous Shocks Facility Trust

3/ Trust for Special Poverty Reduction and Growth Operations for the Heavily Indebted Poor Countries and Interim ECF Subsidy Operations

4/ Multilateral Debt Relief Initiative

5/ Catastrophe Containment and Relief Trust

1/ All credit arrangements under the NAB that were effective as of end-April 2017.

2/ Effective 2012 and 2016 bilateral borrowing agreements, approved 2016 bilateral borrowing agreements expected to become effective shortly, and pledges to the 2016 borrowing agreements by members whose agreements were at advanced stages under their domestic processes as of end-April 2017. Amounts based on end-April 2017 exchange rates.

3/ Cumulative loan commitments to the PRGF-ESF Trust as of end-April 2017.

4/ Total bilateral resources received or pledged since 1987 for subsidizing concessional lending, and HIPC, MDRI and CCRT debt relief, as of end-April 2017.

5/ Cash contributions to the IMF for technical assistance and training (excluding in kind contributions), FY1999-FY2017.

6/ Including Czech Republic, Estonia, Korea, Latvia, Lithuania, Malta, Singapore, Slovak Republic, and Slovenia.

7/ Including China, P.R. Hong Kong SAR and Macao SAR.

8/ Currently PRGT-eligible countries.

9/ Except for capacity development, which is in millions of US dollars.

I. INTRODUCTION¹

1. This appendix discusses the required data, the selection of the database, and the derivation of the data series used for the quota calculations.
2. The quota database is updated annually with the latest information as of end-January of the previous year. This year, the required data series were updated with data through 2015. The remainder of this paper is structured as follows: Section II describes the required data, Section III discusses selection of the database, and Section IV concludes with a description of data availability and adjustments.

II. REQUIRED DATA

3. The quota database requires the following data for all 189 member countries (converted into SDRs as the common denominator):²
 - *GDP at market prices* for three years (2013–15).
 - *PPP GDP* (GDP at purchasing power parity) for three years (2013–15). PPP GDP for a given economy is the volume of goods and services produced for final uses by that economy relative to other economies. It is calculated by deflating GDP at market prices by the PPP price level index, allowing comparisons across countries for a given period.
 - *Current receipts* (goods, services, primary income, secondary income, and capital account)³ for 13 years (2003–15). Current receipts are defined as the credit component of all economic transactions between resident and nonresident entities other than those relating to financial transactions.
 - *Current payments* (goods, services, primary income, and secondary income, and capital account)⁴ for five years (2011–15). Current payments are defined as the debit component of all economic transactions between resident and nonresident entities other than those relating to financial account transactions.

¹ Prepared jointly by FIN and STA. GDP and balance of payments data for the updated quota calculations were compiled by STA in coordination with FIN.

² The cutoff date for both *IFS* and *WEO* data was January 31, 2017; in the case of the latter, the cutoff date implied the use of the Fall 2016 *WEO* database.

³ The balance of payments data are based on the *Balance of Payments and International Investment Position Manual*, sixth edition (BPM6). To help ensure comparability with previous quota calculations, both current and capital transfers—excluding exceptional financing, to the extent possible—are included here in current receipts, where such data is available.

⁴ Ibid; exceptional financing transactions are only on the credit side of the current and capital accounts.

- *Net capital flows* for 13 years (2003–15). Net capital flows relate to cross-border transactions of the financial account in all external financial assets and liabilities except reserve assets, credit and loans from the Fund, and exceptional financing. This measures net financial flows.⁵
- *Official reserves*, defined as the sum of the average over the 12 months of 2015 of foreign exchange, SDR holdings, reserve position in the Fund, and monetary gold valued at SDR 35 per fine troy ounce.

4. Errors and omissions have not been included in the measure of variability of current receipts and net capital flows. Errors and omissions are, by definition, a residual item, which reflects recording errors that cannot be ascribed to any particular balance of payments category. Consistent with past practice, these recording errors are not incorporated into the variables of the quota database.

5. Along the same lines, transactions in both reserve assets and reserve-related liabilities should be excluded from net financial flows (referred to as “net capital flows”) so that only autonomous and not financing flows are captured. Data on transactions in reserve assets are available for most members in International Financial Statistics (IFS) and have been excluded from net capital flows. However, because of the continuing lack of data on reserve-related liabilities for many members, changes in reserve-related liabilities have not been excluded from the measure of net capital flows in this database. Although reserve-related liabilities are not a standard component in BPM6, short-term reserve-related liabilities on a remaining maturity basis are a memorandum item to the international investment position.

6. Credit and loans from the Fund, and exceptional financing have been excluded from the variability measure for the same reason that reserve asset changes have been excluded. Such transactions, including borrowing from the Fund, accumulation and repayment of arrears, and debt forgiveness or rescheduling, represent exceptional measures undertaken to finance balance of payments needs. In the analytic presentation of the balance of payments, exceptional financing flows are shown “below the line” because they are not autonomous balance of payments transactions. For these reasons, and consistent with past practice, these transactions are not included in the variability measure.

III. SELECTION OF THE DATABASE

7. The database containing the variables used in the quota calculations would ideally have the following attributes: it should be comprehensive, i.e., contain all required data—compiled in line with internationally accepted concepts and definitions—for all members; the data would be from official sources (central banks and national statistical agencies); and the data would be comparable (consistent and coherent) across time and countries. This would ensure similar treatment for all countries’ data and facilitate the comparability of results in a transparent manner.

⁵ The variable is referred to as “net capital flows” to maintain continuity with the term used in previous quota calculations.

8. As in past quota updates, the main source of data used in the quota calculations was the Fund's central macroeconomic database of country, regional, and global statistics. STA manages this database (using a data processing system known as DMXplus) for international statistical cooperation and publication purposes, and to support the Fund's surveillance and use of Fund resources functions.⁶ The database, which encompasses a number of component databases, embodies, to the extent possible, the application of international statistical methodologies for the compilation of economic and financial data. Gap-filling and aggregations are performed in the EcOS data management system.

9. The *IFS* data are reported to STA by central banks and national statistical agencies, and are mostly based on internationally consistent definitions, such as the *BPM6*⁷ and the *1993/2008 System of National Accounts* (1993/2008 SNA). While ideally one would aim for long time series that are consistent across time and countries, data gaps exist. For instance, there are some missing data for GDP and current and financial account transactions for some countries for some years.

10. Missing observations were largely supplemented using the World Economic Outlook (WEO) database. For countries whose authorities continue to report in BPM5 framework, a conversion matrix was used.⁸ Compared to the previous template, the new BPM6 template used by the WEO introduced a number of changes, some of which impacted on the gap-filling procedures as follows: (i) more details became available for some series (e.g., gross flows were included on *an optional basis* for primary income, secondary income, and capital account, as well as for the IIP (total assets and liabilities)); and (ii) some indicators used in the calculation of the net capital flows were removed (net credit and loans from the IMF) or became optional (the exceptional financing series). To the extent possible, STA collected additional information from IMF country desks on the gross flows series underlying the variables included in the quota that were not reported to WEO (optional reporting) or no longer required by the new template. WEO does not collect separate data for goods for processing or for reverse investment. Unless the authorities reported BPM6 data to desks, no imputations were made by STA for these variables. This is consistent with the generic conversion of reported IFS data where, if a country did not report data for goods for processing or reverse investment, no imputations were made.

11. At the outset of the development of the database for the quota calculations, STA was aware that for some member countries there were large differences between the IFS and the WEO data sets. These data discrepancies between the two data sources may also have been influenced by the

⁶ In this paper, the data drawn from the DMXplus are referred to as the IFS database, following the practice in past quota review papers.

⁷ Starting with the August 2012 IFS, STA publishes balance of payments data using the BPM6 presentation. Therefore, starting with the 2013 quota data round, in consultation between STA and countries, data were converted to a BPM6 presentation using generic conversion rules developed by STA, for around one-third of the countries that continue to report on a BPM5 basis.

⁸ The conversion matrix was developed by the WEO team in collaboration with STA to assist IMF country desks with the conversion of BPM5 series to BPM6.

varying institutional, legal, and accounting contexts of data compilation across member countries (Boxes A1 and A2).

Box A1. Methodological Issues

With regard to GDP data, the 1993 SNA extended the scope of GDP slightly, adding production of goods for own final use to output and mineral exploration, computer software, and artistic originals to capital formation. This has resulted in an increase in reported GDP levels. Most IMF members have adopted the 1993 SNA for reporting GDP data to the IFS with some of them having revised historical data. By now, the size of data inconsistencies across countries due to the revisions related to the 1993 SNA is likely to be smaller than other differences related to known measurement problems with GDP (e.g., under-coverage of surveys, outdated base years, or differing adjustment methods for the size of the non-observed economic activity).

Further changes introduced by the System of National Accounts 2008 (2008 SNA) have impacted on GDP and other macro-economic aggregates for member countries. Some of the noteworthy changes brought out by the 2008 SNA are: including research and development expenditures in gross capital formation rather than in intermediate consumption, and including depreciation of research and development assets in consumption of fixed capital; including net acquisitions of weapon systems in gross capital formation rather than in government final consumption, and including depreciation of military assets in consumption of fixed capital; making refinements to the calculation of Financial Intermediation Services Indirectly Measured for loans and deposits using a reference rate and requiring implementation of the reference rate method rather than treating it as an option; and calculation of non-life insurance output using the adjusted claims and the adjusted premium supplements. Where they are relevant, these changes are expected to increase GDP. Some countries, e.g., Australia, Canada, European Union members, USA, Brazil, India, Indonesia, Mexico, Philippines, South Africa, Uganda, and Kenya have already moved to the 2008 SNA, others are in the process of implementing it.

With regard to BOP series for quota calculations, the current receipts and payments cover goods, services, primary income, secondary income, and the capital account. The capital account, which includes capital transfers and acquisition/disposals of non-produced nonfinancial assets, ensures comparability with previous quota calculations. Starting with July 2015 IFS issue, the IFS (and the on-line Balance of Payments Statistics database) excluded the migrants' transfers from the capital account, in line with BPM6 guidance. These had originally been retained since the 2012 launch of the BPM6-basis generic-converted series to ensure consistency with the balance of capital account and net errors and omissions series in the BPM5-based series.

With regard to financial account transactions, the accuracy of financial account data in many countries, including those in the IFS database, is uneven and the data are generally less comprehensive than the

Box A1. Methodological Issues (concluded)

other data used for the quota formulas. This reflects classification and practical difficulties encountered by countries in compiling the data. Financial account data, particularly on the private nonbank sector, are generally difficult and resource intensive to compile. The switch from data collection systems based predominantly on government and balance sheet records to systems (particularly surveys) incorporating large private nonbank sector transactions has been slow. Many countries are still in the midst of adapting their collection and recording systems to take account of changes in the composition and magnitude of financial transactions, including new instruments such as financial derivatives. Institutional and accounting requirements for data compilation may differ across countries and data availability on the private nonbank sector varies. In the IFS, in some instances, only aggregates and not component series are reported.

With regard to official reserves, the majority of IMF members follow accepted international practices in reporting their data for dissemination in the Fund's main statistical publications, the IFS and the monthly online Balance of Payments Statistics database. BPM6 contains a number of clarifications for the reporting of reserve assets. Box A2, Changes with BPM6, includes clarifications on the currency composition of the official reserves. In addition, SDDS subscribers and SDDS Plus adherents disseminate data in the Data Template on International Reserves and Foreign Currency Liquidity. The updated *[International Reserves and Foreign Currency Liquidity: Guidelines for a Data Template](#)* (Guidelines) are consistent with BPM6 and available on the IMF website at <http://www.imf.org/external/np/sta/ir/IRProcessWeb/dataguide.htm>.

IV. DATA AVAILABILITY AND ADJUSTMENTS

12. The data stored in the IFS database were used as reported, where members reported balance of payments statistics to STA. Of the 189 members, the number reporting data to IFS for at least some of the years are as follows: 179 for the period 2003–15; and 175 for the period 2011–15. When data were not available for some members for the timeframe required for the quota calculations, estimates were made, largely on the basis of the WEO, as described above.⁹ For members where neither IFS nor WEO data were available, FIN obtained data from staff reports and IMF country desks. The number of countries reporting their BOP data under BPM6 has been increasing, 133 Fund members now report their own BPM6-based balance of payments statistics to STA; the remainder that still provide data on the basis of BPM5 are then converted by STA into BPM6 format (see Box A2). In order to compile the current receipts and payments and net capital flows, data sets were prepared as defined above.

13. The data source breakdown for the period 2003–15 is as follows: of the 179 members reporting data for IFS—for 130, data are derived entirely from IFS reported data, for 44, data are derived from a combination of IFS and WEO estimates, for 3, data are derived from IFS and WEO but have missing data for some years, and for 2, data are derived from IFS reported data and have

⁹ The methods used to fill gaps were, in principle, largely similar to those used for the purpose of publishing World and Regional Tables in the Balance of Payments Statistics Yearbook (BOPSY), and were described in External Review of Quota Formulas—Quantification (4/12/01).

missing data for the current year (no WEO data available); for the 10 members not reporting any data to IFS—for 7, data are derived entirely from WEO estimates and for 3 (Nauru, San Marino and Somalia), data have neither IFS nor WEO data available.

14. The data source breakdown for the period 2011–15 is as follows: of the 175 members reporting data for IFS—for 143, data are derived entirely from IFS reported data, for 31, data are obtained from a combination of IFS and WEO estimates, and for 1, data is derived from IFS reported data and has missing data for the last two years (no WEO data available); for the 14 members not reporting any data for IFS—for 10, data are derived entirely from WEO estimates, four countries (Nauru, San Marino, Somalia, and Syrian Arab Republic) have neither IFS nor WEO data available.

15. The following sections describe for each of the data categories the general procedures employed by STA to construct the required database for the quota calculations.

Goods and Services Transactions

16. Data reported by members and maintained in IFS were used for each country. Where there were data gaps prior to or after the latest year of reporting to STA, estimates were made by applying the growth rates derived from the WEO to the closest reported data (credits and debits). For countries where no data were reported to STA, available WEO data were used. For China, P.R., Hong Kong, SAR, and Macao, SAR, goods data were adjusted for trade among the mainland, Hong Kong, SAR, and Macau, SAR based on the Direction of Trade database.¹⁰

Primary Income, Secondary Income, and the Capital Account

17. Data on primary income and secondary income reported by members and maintained in IFS were used for each country. Where there were data gaps, estimates were derived using WEO data series. The adjustment procedure consisted of the following: (1) if available, WEO gross flows are used; (2) if not, and the gap was in the leading year(s) of the series (2003), then WEO net value was inserted for the leading year(s) where data were missing, either as credits if WEO showed a net credit balance or as debits if a net debit balance was shown in WEO; (3) if the gap was after a reported observation, then the WEO net value was used for each year; also, the latest reported debits and credits were carried forward; however, to assure that gross debits and credits are consistent with the net values shown, a positive adjustment is made to the carry forward credit when the net WEO value shows a higher net credit, or to the carry forward debit when the net WEO value shows a higher net debit.

¹⁰ Balance of payments (BOP) trade in goods data are reported in IFS on a BPM6 basis and do not include goods for processing (GFP), while the Direction of Trade Statistics (DoT) includes all trade in goods. While staff was able to adjust for this factor in previous databases, this is no longer possible with the move to BPM6 reporting. As such, using DoT to adjust the BPM6 data for intra-trade may lead to an over-estimation of the intra-trade flows. Based on data available for the quota database updated through 2011, any such over-adjustment is likely to be small.

18. The primary source for data on the capital account as per BPM6 is the IFS data provided by member countries. When no data are reported for IFS, the WEO gross flows were used, if available. If not, the WEO net capital account value, depending on its sign, was used to derive an estimate. In a few cases, countries reported to IFS only “net” capital account data. When a country reports to IFS only a net value for the capital account, that full value is allocated to credits (if positive) or debits (if negative). Countries reporting under BPM6 have eliminated migrants’ transfer from their capital accounts (according to BPM6, a change of ownership is no longer imputed).

Net Capital Flows¹¹

19. The primary source for data on net capital flows is the IFS financial account data provided by member countries to STA. When no data are reported for IFS, WEO values are used to fill in the gaps, to the extent possible. While the IFS provides the financial account balance in the analytical presentation (i.e., net (standard) financial flows excluding the group consisting of (i) reserve assets, (ii) exceptional financing, and (iii) the net credit and loans from the IMF), the new WEO template no longer covers some of these components. Data on net credit and loans from the IMF for all countries were sourced from the IFS database, while the exceptional financing data for the missing data entry points were obtained from WEO and some from the desks, to the extent possible.

Official Reserves

20. Position data on official reserves—comprising monetary gold, SDR holdings, reserve position in the Fund, and foreign exchange holdings—were obtained from IFS.¹² Monetary gold was valued at SDR 35 per fine troy ounce. In deriving annual average holdings of official reserves for 2015, for each reserve component, the average data for each of the 12 months of 2015 were summed and then divided by 12. SDR holdings and reserve position in the Fund are based on Fund accounts and data are available for the entire period. However, data for foreign exchange is not always reported for the entire 12-month period. If this is the case, the number of months for which data were reported was used to calculate the average. If a country did not report its foreign exchange and/or monetary gold holdings data to STA for publication in IFS, staff reports are used to gap fill this information (see also missing data series, below).

GDP

21. The IFS and WEO databases provided GDP data for 186 members (all Fund members except Somalia, Syrian Arab Republic and Nauru). The IFS database is the source of data for 152 members, WEO data were used for 17 members, and WEO growth rates were applied to the latest IFS data to

¹¹ The term “net capital flows” refers to transactions in the financial account.

¹² Consistent with the treatment of reserves for the 2001 ad hoc quota increase for China, P.R., the reserves of Hong Kong, SAR and Macao, SAR are not included for quota calculations.

estimate missing data for 17¹³ members. When IFS data were missing for a long period (i.e., most recent data are for 2009 or earlier), these have been directly replaced by WEO estimates, otherwise WEO growth rates were applied to the last available IFS observations.

PPP GDP

22. The PPP-based GDP data reflect the new ICP rates and were derived using the WEO methodology for 186 countries (all Fund members except Nauru, Somalia, and Syrian Arab Republic). Under the WEO methodology, PPP-based GDP is calculated by dividing a country's nominal GDP in domestic currency by its PPP price index relative to the United States¹⁴ and then converting it into SDR units, using the SDR-USD exchange rate. The PPP price indices are based on the data from the International Comparison Program (ICP) for 2011 that were released in April 2014.¹⁵ These data were then extended forward (to 2015) by using the growth in relative GDP deflators (the deflator of a country divided by the deflator of the United States).¹⁶ The data for Somalia were estimated using its share in global GDP based on 11th Quota Review data (see para 24). For Syrian Arab Republic, the 2010 observation was repeated for 2011–15.

Conversion to SDRs

23. The balance of payments and the GDP data series in U.S. dollars were converted to SDRs using period-average exchange rates.

Missing Data Series

24. Data that were missing from IFS and WEO were obtained almost entirely from recent staff reports. For Somalia all series except PPP GDP were taken from 2016 Somalia Article IV document, which provided data only for 2013, 2014, 2015. For the years before 2013, the data were assumed to

¹³ This includes countries which did not have IFS data for the reference three years but supplied data for the years immediately preceding the reference period. For comparison, WEO growth rates were applied in the case of 17 countries in the database extending through 2015 (versus 38 in the previous database update).

¹⁴ The choice of the numéraire country is arbitrary and does not affect the calculations, since PPP price indexes are adjusted to be transitive across countries.

¹⁵ See *Purchasing Power Parities and Real Expenditures of World Economies – Summary of Results and Findings of the 2011 International Comparison Program*, 2014. The 2017 round of the ICP is proceeding as scheduled with results expected during 2019. The benchmark estimates for 2017 will be based on a transition to a rolling survey approach (beginning in 2017) which involves spreading the price data collection over a three-year time period around the reference year. The Technical Advisory Group (TAG) of the ICP met during May, 2017 and agreed on a plan to address technical and research questions in the ICP via smaller, specialized task forces. The next ICP Governing Board meeting is confirmed for September 15, 2017 and the 4th ICP Inter-Agency Coordination Group (IACG) meeting will take place during the week of October 23–27, 2017. The Statistics Department is represented on the IACG and the ICP Governing Board.

¹⁶ The computation of the PPP GDP data was performed by the Research Department. The data for the GDP in local currency and the GDP deflators were obtained from the October 2016 WEO, consistent with the January 31, 2017 data cutoff date for the quota data.

be equal to 2013 values. For PPP GDP, the market GDP ratio is used to estimate the PPP GDP. Syrian Arab Republic stopped reporting its data as of 2010; the 2010 observation has been repeated ever since. For San Marino (2003–15) and South Sudan (2003–10), all variables except GDP and official reserves were derived from staff reports. For Libya, all variables except GDP, PPP GDP, and official reserves were missing for the last two years, which were gap-filled using 2014 data submitted last year and repeating it for 2015. For Nauru, all variables are gap-filled using the IMF country desk data.

25. Countries for which only official reserves data were derived from staff reports or country desk economists include Eritrea, Ethiopia, Ethiopia, Guinea, Iran, Kiribati, Nauru, Somalia, Turkmenistan, Tuvalu and Uzbekistan.

26. Gaps in data for current receipts for the following countries were filled using staff reports or data provided by country desk economists: South Sudan (2004–10), Iraq (2003), and Montenegro (2003–5). For Bahrain, the current receipts data from the desk better reflected latest updates and were used instead of the IFS data.

27. Gaps in data for net capital flows for Syrian Arab Republic (2002–06) and Marshall Islands (2003–04, and 2015) were filled using staff reports or previously reported data. For Bahrain, financial account data from the desk better reflected latest updates and were used instead of IFS data. For Egypt, GDP data for 2015 were gap-filled using area department data.

Box A2. Changes with BPM6

The *Balance of Payments and International Investment Position Manual*, sixth edition (BPM6) introduced a number of changes to data underlying the variables included in the quota formula. The IFS (and the on-line Balance of Payments Statistics database) began publishing data using the BPM6 presentation exclusively starting in August 2012. Full implementation of BPM6 by IMF member countries will continue over the next years (133 members reported their own BPM6 data as of end-January 2017), and as a result, there will be a mixture of BPM5 and BPM6 reporting that will affect future quota database updates. The main changes affecting quota data are:

- **Treatment of goods for processing:** BPM6 captures in trade flows (recorded under services) only the explicit fees that are paid to the goods processor, rather than the full value of the goods entering and leaving the processing economy, in the case where the goods do not change ownership. This change will particularly affect those countries for which goods for processing are important in its trade; and will take longer for some countries to implement since it requires additional data collection. This modification will reduce openness for those countries where goods for processing is a significant component of their trade; variability could also be affected, especially, if revisions do not cover the full 13-year period used to estimate this variable. This change reduces the “double counting” of trade, which has been a concern in previous discussions on quota variables.

Box A2. Changes with BPM6 (concluded)

- **Migrant transfers:** under BPM6, the personal effects, financial assets, and liabilities of persons changing residence are no longer covered by a capital transfer.
- **IIP coverage:** The IIP is more prominent in BPM6 than in BPM5. Partly as a result of this increase in emphasis, efforts are underway to strengthen coverage of the IIP, which has been considered as a measure of financial openness. Official coverage has been improving in recent years and it is expected to continue (as of end-January 2017, 122 members reported IIP in BPM6 format).
- **Recording of foreign direct investment (FDI):** FDI is included in gross financial flows and the IIP data, which have been discussed as alternative measures of financial openness in previous quota papers. Under the BPM5 methodology, some components of the direct investment account are netted out. Starting with BPM6, direct investment components are shown on a gross basis. All of the components of FDI needed to construct the BPM5 measure of FDI are collected separately (as standard components) under BPM6, and so this is a presentational change and not a change in data collection.
- **SDR allocations:** The inclusion of the 2009 SDR allocations as liabilities in the financial account, and the inclusion of an equal size increase in SDR holdings as assets in the financial account, impacted the calculation of gross capital (financial) flows. Similarly, (cumulative) SDR allocations are shown in the IIP as liabilities. BPM6 did not introduce changes in the treatment of SDR holdings in the IIP; SDR holdings were recorded in the IIP under both BPM5 and BPM6. Unlike the other changes noted above, STA implemented this particular change effective with reporting of data for 2009, ensuring that the new SDR allocations implemented in that year would be recorded in all member country data consistent with the latest approved methodology. STA has traditionally used the IMF's own data (provided by FIN) for recording positions and transactions related to SDRs in IFS.
- **Reserve assets:** In the case where an economy has risk exposures that are closely related to its neighbor (perhaps due to substantial trade ties), and where it holds assets denominated in the currency of its neighbor, BPM6 clarifies that these holdings should be excluded from reserves if that currency is not convertible. Under BPM5, it was less clear whether such holdings could be included in reserves.
- **Treatment of Special Purpose Entities (SPEs):** Some countries, i.e. the Netherlands, Cyprus, and Malta, have recently experienced significant revisions to their BOP and IIP data as a result of incorporating the SPEs in the BPM6 estimates. Generally, the SPEs are located in either important offshore financial centers or involved in non-financial sector activities, or both. In the external sector, the SPEs are treated as resident companies of the host countries, generally owned by multinational enterprise groups mostly active abroad and having weak ties with the host economy. In the financial sector, for example, these companies act as intra-group financial intermediaries, channeling funds whose volume and direction are regulated by the parent companies. The most affected entries in the external sector are direct and portfolio investment (flows and stocks), as well as the related investment income.

Source: Finance Department.

n.a.: non-available.

1/ Based on the current formula: $CQS = (0.50 \times GDP + 0.30 \times Openness + 0.15 \times Variability + 0.05 \times Reserves) \times K$. GDP blended using 60 percent market and 40 percent PPP exchange rates. K is a compression factor of 0.95. Years in parentheses indicate the end period for the IFS data used in the calculations.

2/ The “2008 Reform” reflects quotas after the “second round” ad hoc quota increases for 54 members agreed in 2008, following the “first round” ad hoc increases for four members agreed in 2006. Includes South Sudan and Nauru which became members on April 18, 2012 and April 12, 2016, respectively. For the two countries, Somalia and Sudan, that have not yet consented to and paid for their quota increases, 11th Review proposed quotas are used.

3/ Includes South Sudan and Nauru, which became members on April 18, 2012 and April 12, 2016, respectively; reflects their quota increases proposed in their respective membership resolutions after the effectiveness of the 14th Review.

4/ Reflects the impact of adjustments to current receipts and payments for re-exports, international banking interest, and non-monetary gold.

5/ Including China, P.R., Hong Kong SAR, and Macao SAR.

Source: Finance Department.

1/ Includes South Sudan and Nauru, which became members on April 18, 2012 and April 12, 2016, respectively; reflects their quota increases proposed in their respective membership resolutions after the effectiveness of the 14th Review.

2/ Based on IFS data through 2015.

3/ Based on IFS data through 2014.

4/ GDP blend using 60 percent market and 40 percent purchasing power (PPP).

5/ Variability of current receipts minus (instead of plus) net capital flows due to change in sign convention in BPM6.

6/ Including China, P.R., Hong Kong SAR, and Macao SAR.

Source: Finance Department.

1/ Includes South Sudan and Nauru, which became members on April 18, 2012 and April 12, 2016, respectively; reflects their quota increases proposed in their respective membership resolutions after the effectiveness of the 14th Review.

2/ Based on IFS data through 2015.

3/ Based on IFS data through 2014.

4/ Current PPP-GDP data were retrieved from the WEO database for 186 countries. For the countries with no WEO data (Nauru, Somalia, and Syrian Arab Republic), PPP-GDP was gap filled.

5/ GDP blended using 60 percent market and 40 percent purchasing power (PPP).

6/ Including China, P.R., Hong Kong SAR, and Macao SAR.

1/ Includes South Sudan and Nauru, which became members on April 18, 2012 and April 12, 2016, respectively; reflects their quota increases proposed in their respective membership resolutions after the effectiveness of the 14th Review.

2/ Difference in the shares for each variable between the current and previous datasets, multiplied by the variable weight in the quota formula. The change in CQS also reflects the effect of compression.

3/ Including China, P.R., Hong Kong SAR, and Macao SAR.

Source: Finance Department.

1/ Includes South Sudan and Nauru, which became members on April 18, 2012 and April 12, 2016, respectively; reflects their quota increases proposed in their respective membership resolutions after the effectiveness of the 14th Review.

2/ Based on IFS data through 2015.

3/ Based on IFS data through 2014.

4/ Current PPP-GDP data were retrieved from the WEO database for 186 countries. For the countries with no WEO data (Nauru, Somalia, and Syrian Arab Republic), PPP-GDP was gap filled.

5/ Variability of current receipts minus (instead of plus) net capital flows due to change in sign convention in BPM6.

6/ Including China, P.R., Hong Kong SAR, and Macao SAR.

1/ Formulas with least total absolute distance from middle ground, in different sets of restrictions:

Set A: (0.70 * GDP + 0.25 * Openness + 0.05 * Reserves) ^ 0.975 with 60/40 GDP blend.

Set B: (0.75 * GDP + 0.20 * Openness + 0.05 * Reserves) ^ 0.975 with 65/35 GDP blend.

Set C: (0.775 * GDP + 0.200 * Openness + 0.025 * Reserves) ^ 0.975 with 60/40 GDP blend.

2/ Including China, P.R., Hong Kong SAR, and Macao SAR.

3/ Shown coefficients may not add up to one due to rounding.

Source: Finance Department

1/ All simulations show distributions based on the quota formula (i.e., selective increases) plus ad hoc increases where needed to protect the shares of the poorest members.
 2/ Including China, P.R., Hong Kong SAR and Macao SAR.

1/ All simulations show distributions based on the quota formula (i.e., selective increases) plus ad hoc increases where needed to protect the shares of the poorest members and with 5 percent of the overall increase allocated as ad hoc increases based on voluntary financial contributions.

2/ Voluntary financial contributions are based on VFCS II, which is the weighted average of contribution shares, with weights of 0.3 for NAB, 0.3 for 2012 and 2016 bilateral borrowing agreements, 0.2 for PRGT loans and concessional financing subsidies combined, and 0.2 for capacity development. See Supplement 1, Annex V for details.

3/ Including China, P.R., Hong Kong SAR, and Macao SAR.

**The Chairman's Concluding Remarks
Fifteenth General Review of Quotas—Quota Formula and Realigning Shares
Committee of the Whole on Review of Quotas Meeting 17/1
September 1, 2017**

This first Committee of the Whole meeting on the 15th General Review of Quotas follows the work program on the 15th Review that we agreed last year with the aim, as endorsed by the Board of Governors, of completing the review by the Spring Meetings of 2019 and no later than the Annual Meetings of 2019. Today's informal exchange of views covered the quota formula and realigning quota shares, and we will meet in two weeks to discuss the adequacy of Fund resources, also in an informal committee setting. These issues are closely interlinked and will ultimately need to be agreed as a package. Many Directors expressed the view that IMF bodies should lead the process and determine the outcome. Let me offer some brief informal remarks that reflect my understanding of the views expressed in today's discussion.

The 15th Review will continue the process of realigning members' quota shares in line with their evolving relative positions in the world economy, building on the 2008 and 2010 reforms. The quota formula seeks to provide a reasonable measure of members' relative economic positions and thereby serve as a guide to changes in the structure of quotas. I heard considerable support for the view that the principles that have guided previous deliberations on the formula remain valid: namely, that the formula should (i) be simple and transparent; (ii) be consistent with the multiple roles of quotas; (iii) produce results that are broadly acceptable to the membership; and (iv) be feasible to implement statistically based on timely, high quality and widely available data. However, views differed on the extent to which the current formula conforms to these principles. One view is that the formula is working well and continues to deliver higher calculated quota shares to dynamic economies. Another view is that the current formula fails to reflect realities in the global economy and requires a major overhaul toward a GDP-centered formula. Bridging this gap will be a key challenge ahead of us.

In this regard, the formula has already been discussed extensively, including under the 2013 Quota Formula Review (QFR), and I sensed a willingness to build on the progress already made. This includes general support for the view that GDP should remain the most important variable, though views continued to differ on its weight and the composition of the GDP blend. I also heard continued support from most Directors for dropping variability, though for a number of them, this support is conditional on other elements of the reform package, while a few other Directors are still not convinced. Openness remains important for many Directors, but views varied on its appropriate weight and measurement. Views ranged

from increasing the weight of openness and maintaining the current methodology, to lowering its weight, introducing a cap, and excluding intra-currency union trade. Views also remained divergent on whether reserves and compression should be maintained at their current levels, adjusted, or eliminated.

Staff's technical exercise to identify reforms that yield results near the midpoint of those implied by the current formula and a GDP-only formula attracted a range of views. A number of Directors found this a useful exercise to illustrate possible pathways toward a middle ground. Many others, while welcoming staff's attempts to look for areas of consensus, felt that it does not adequately represent the range of views being expressed, gives too much prominence to a GDP-only formula, and, in their view, is not in line with the 2013 QFR.

Views also remained divided on whether and if so how to take account of voluntary financial contributions. Many Directors supported, or were open, to taking account of such contributions in quota adjustments under the 15th Review, with a few preferring their inclusion in the quota formula. Many other Directors continued to oppose or express reservations about such approaches. Clearly, more work will be needed to bridge these different viewpoints.

I welcome Directors' continued commitment to protect the quota and voting share of the poorest members under the 15th Review. Views varied on the precise definition of poor countries to be protected, and many Directors called for protection also for small member states.

We also had a very preliminary discussion of alternative approaches to distributing quota increases under the 15th Review. A few Directors highlighted the importance of selective increases and the possible role for ad hoc increases in realigning quota shares and helping to facilitate a compromise. This is clearly an area where discussions are at a very early stage, and is closely linked with the work on resource adequacy.

To conclude, today's meeting has provided useful feedback and clarifications of views. In light of this discussion, management and staff will reflect on how best to take forward the work on the quota formula and realigning quota shares in the context of the broader discussions on the 15th Review. While there is clearly a lot of work ahead of us, I believe we have made a good start. I hope that, with flexibility, pragmatism, and openness from all sides, we can achieve a compromise that can command broad support consistent with the IMFC's commitment to a strong, quota-based and adequately-resourced IMF at the center of the global financial safety net.
