## I. INTRODUCTION

1. Securities markets have expanded rapidly during the last two decades and an increasing number of securities are issued and traded in organized markets, both domestically and internationally. The distinction between international issues (in which only foreign buyers are assumed to be active) and domestic issues (in which only resident buyers are assumed to be active) has become less meaningful; this may have possibly resulted in a lower quality of data collected at the national level.

2. The growth of financial markets has been accompanied, on the other hand, by a market-driven process of standardization of securities traded, which may facilitate the collection of high-quality information on portfolio investment flows and stocks. For example, international standards for the identification of securities have been established by the Association of National Numbering Agencies (ANNA). These comprise the International Securities Identification Number (ISIN code), the Classification of Financial Instruments (CFI), and the GIAM network (for which the latest version is GIAM2) that allows access to the records of all national numbering agencies. In addition, commercial databases have become a primary source for determining the current market valuation of individual securities, information on outstanding issues, and other country information. With this background in mind, a *Working Group on Securities Databases* (Working Group) comprising the BIS, ECB and IMF, was established by the IMF Committee on Balance of Payments Statistics at its meeting in Santiago in October 1999.

3. The members of the Working Group met in February 2000 and agreed a work program for the year 1999/2000 (Appendix 1). To accomplish the goals of the work program regarding country practice in their use of securities databases, it was decided to conduct a questionnaire rather than hold a meeting with countries. It was also decided that the questionnaire include a brief summary of the benefits of data exchange (Appendix 2). For the time being it was decided not to invite country participation in the Working Group, which was left as an option for later consideration. The work program for 1999/2000 comprised :

- Undertaking a survey of the countries represented on the Coordinated Portfolio Investment Survey Task Force (*joint BIS-ECB-IMF Questionnaire on Securities Databases*) aimed at determining: (1) the size of securities markets in those countries and the availability of data sources; (2) whether securities databases (SDBs) have been established and for what purpose; (3) the benefits to statistical compilers from the use of SDBs and their experience of start-up and maintenance costs; (4) the prospects of establishing national SDBs that serve multipurpose statistical and policy needs; (5) the use that European member countries may make of ESCB's centralized securities database (ESCB-CSDB); (6) countries' plans to establish or further develop national SDBs in the next few years; and (7) countries' views on what they would need from other countries' SDBs to address perceived deficiencies in their own SDBs (or multipurpose SDB) regarding the coverage of securities issued by their residents abroad. The Survey asked countries what use they planned to make of their national SDBs and, potentially, the ESCB-CSDB for the 2001 CPIS. For members of the European

Union, an addendum was added to the questionnaire to provide input for ECB in completing its assessment of the feasibility of the ESCB-CSDB project.

- Identifying the elements of a “model Centralized Securities Database” (CSDB) that would meet the needs of CPIS compilation in a country and facilitate data sharing between countries. In so doing, the model CSDB had to distinguish between: (1) non-price attributes of securities issued and information concerning the residency and sector of the issuer; (2) price attributes of securities issued, and (3) information concerning the residency and sector of the holder. A distinction had also to be made between mandated items (basic needs for CPIS compilation and data sharing) and encouraged items (needed for quality control purposes).
- Reviewing the benefits from the adoption of standard formats and coding for the model CSDB and modalities for establishing them.
- Investigating the following aspects of a supra national SDB (based on this analysis and assuming that a model CSDB could be agreed): (1) the establishment of bridge tables between countries’ national SDBs and the model CSDB that would facilitate data exchange; (2) a preliminary assessment of the adequacy of basic data sources by drawing on country experience; this included an assessment of the GIAM2 network, the use of ISIN masterfiles maintained by countries and the BIS, the use of commercial databases, the use of other national sources, and the work of the national compiler in “cleaning up” these sources; and (3) a review of the modalities for data exchange between countries. A first step towards promoting data exchange was to identify a core group of countries covering the main financial markets whose participation was needed to ensure that there were appreciable benefits of data exchange.

In the event, it was possible to address only the first of these objectives.

4. The joint BIS-ECB-IMF Questionnaire on Securities Databases was intended to provide feedback to the Working Group on Securities Databases and material to include in the revised Coordinated Portfolio Investment Survey Guide. The questionnaire contained 18 questions seeking information on countries’ experience in developing securities databases (SDBs).<sup>1</sup> The questionnaire addressed benefits derived or envisaged from this experience (in various areas of statistics); the implications of these developments for adopting a security-by-security approach for the 2001 CPIS; how the quality of their CPIS could be enhanced by being able to access national SDBs in other jurisdictions; and what implications this had for their adopting a security-by-security approach to data collection for the 2001 CPIS (see **Figure 1**).

---

<sup>1</sup> For this purpose, a securities database was defined as a directory of securities issued by domestic and foreign entities that may contain additional information pertaining to the issuer and the security.

5. The questionnaire was sent to all countries that participated in the 1997 CPIS, with the only exception of Bermuda; plus Germany, Luxembourg, and Greece, which did not participate in the 1997 survey. Responses from European Union (EU) countries were coordinated by the ECB.

6. Twenty-three countries provided responses to the questionnaire. As yet, no response has been received from Chile, Iceland, Indonesia, Malaysia, Norway, Singapore, and Venezuela. (As soon as new information is received, the present paper will be updated to include late responses.)

7. The results of the questionnaire are summarized in the next two sections.<sup>2</sup>

## II. EXISTING SECURITIES DATABASES

### A. Available data

8. Fourteen countries, including those that will participate in the 2001 CPIS on an only aggregate basis, maintain securities databases (SDBs) at the national level. These countries are: Argentina, Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Italy, Portugal, Spain, United Kingdom, and United States (**Table 1**). Such databases are used for a variety of purposes, comprising (a) compilation and/or cross-check/validation of BOP and IIP statistics; (b) compilation of statistics on Money and Banking, External Debt, and Securities issues; and (c) fulfilment of legal requirements.

9. Existing SDBs differ greatly as to *type and amount of information contained*, which varies in accordance with their original purpose and sources used to build and maintain them (**Tables 2-5**). Most financial instruments are covered, including unquoted shares; information on financial derivatives is only maintained by six countries (Australia, Austria, Belgium, France, Italy, and Portugal). All databases contain information on *securities issued*, the most frequent being, in particular: identification codes, textual descriptions, nominal values and amount issued, currency of issue, market of issue and reference market, security prices, coupons, maturity, and amortization. ISIN codes are used by twelve countries; CUSIP by four countries; in a large majority of cases, *ad hoc* codes are also used. Information on end-period security prices is contained in the databases of twelve countries; seven countries also maintain data on period-average prices. Also contained is information on *securities issuers*, in particular: issuer name and/or identifier, sector, name of syndicate, and country of residency (for nonresident issuers). This latter information is available in the databases of thirteen countries; only four countries maintain data on the country of residency of the issuer's parent enterprise (France, Spain, United Kingdom, and United States). The availability of information on *securities holders* is, on the

---

<sup>2</sup> This assessment does not cover responses to the addendum to the questionnaire (ECB Satellite Questionnaire) that was completed by member countries of the European Union. An oral report on these responses will be provided by ECB to the IMF Balance of Payments Committee within the context of its report on the status of the ESCB-CSDB.

other hand, scarcer than information on security issuers, even with regard to resident holders. The *update frequency* of such databases generally varies between one-month and daily intervals. Updating is in real time in only two cases (Belgium and Denmark); in the case of the US, the database is updated at 5-year intervals.

### **B. Quality assessment**

10. As to the *coverage and reliability* of data contained in national SDBs, many countries highlighted deficiencies in existing sources of information on securities issues made abroad by resident issuers, with the only exception of France and US. On the other hand, sources used for domestic issues were considered more satisfactory. Among the *areas that needed to be improved*, the most critical problems faced by countries participating in this survey were (a) valuation of securities at market prices and (b) calculation of investment income on an accrual basis.

### **C. Perceived benefits and costs**

11. Regarding the perceived benefits of existing securities databases, 12 countries indicated that the burden for respondents could be diminished through the use of SDBs; one half of these countries indicated that burden would be reduced only to a limited extent. In all cases, statistical compilation benefited from the use of a securities database, in terms of (a) correct classification of issues as to instrument used and sector of issuer, (b) correct geographical allocation of securities issued by nonresidents, (c) more accurate calculation of investment income on an accrual basis, and (d) more accurate valuation of securities at their market price.

12. Regarding the perceived costs of establishing securities databases, the main costs envisaged were those of software development. Both fixed and variable costs are likely to be significantly affected by: (a) the degree of complexity of the SDB; and (b) by the extent to which such SDBs are obtained as a by-product of other activities conducted by the relevant agency.

## **III. FUTURE PLANS OF COUNTRIES AS REPORTED IN THE SURVEY**

### **A. Enhancement of National SDBs and Establishment of National Multipurpose SDBs**

13. *Plans to augment or integrate existing securities databases*—Only two of the countries currently maintaining one or several SDBs indicated that there were plans to develop it further, or integrate existing databases, into a single multipurpose SDB: France and United Kingdom; Italy already had a multipurpose SDB. However, various countries in this group indicated the intention to supplement the data contained in their existing databases with more information on securities, issuers, and holders: this extended set of data comprises CUSIP codes (for countries that use only ISIN codes) and more detailed information on securities prices such as period-average, period-maximum, and period-minimum.

14. *Plans to create a securities database* —On the other hand, three countries that do not currently maintain any SDBs indicated an intention to establish an SDB for statistical compilation purposes: Greece, Israel, and Korea.

### **B. Cross-country cooperation**

15. Countries were asked whether there was an interest in having *access to SDBs maintained abroad*, which could include information on their own domestic securities issued in the jurisdiction of third countries. All respondents were interested in having access to foreign databases, with special reference to various data on security issues (made by both residents and nonresidents) and foreign holders of domestic securities.

16. Countries were also asked whether they would have been willing to contribute to a *global SDB maintained by an international organization*: in particular, by helping verify the “genuine” residency of securities deemed to be issued by their domestic residents. An overwhelming majority of countries indicated their readiness to contribute; respondents also indicated their readiness to use the data contained in the global SDB for compiling and/or validating their own national data, as they considered that global information would have a strongly *positive impact on their statistical products*. However, various countries noted that the type and quality of such “global” data should be investigated thoroughly before they could be used at the national level.

### **C. Plans to Use SDBs for the 2001 CPIS**

17. Nine countries noted that there were plans to use a security-by-security approach for the 2001 CPIS: Argentina (excluding portfolio investment holdings of the nonfinancial private sector), Austria, Canada, France, Greece, Israel, Italy, Portugal, and the United States. Ten countries will participate in the survey on an aggregate basis: Australia, Belgium, Finland, Germany, Ireland, Japan, The Netherlands, New Zealand, Sweden, and the United Kingdom.

## **IV. PROPOSED WORK PROGRAM FOR 2000/2001**

18. Based on the results of the questionnaire, it was concluded that a prima facie case has been made for data exchange between countries that use securities databases in support of the security-by-security approach to compiling cross-border portfolio investment statistics as well as for other purposes. In addition, the broad parameters of which data could usefully be exchanged were also established.

19. It is recommended that the next steps to be addressed by the Working Group in its work program for 2000/2001 should be focused on a core group of countries and comprise work towards: (i) Assessing the quality of information in securities databases in those countries (SDBs); (ii) evaluating differences between the SDBs (including the ESCB-CSDB); (iii) identifying the elements of a model centralized SDB; (iv) establishing bridges between existing SDBs and the model centralized SDB that would facilitate data exchange; and (v) determining the modalities for data exchange. With regard to the latter item, it is proposed that the Working

Group undertake a preliminary investigation into the feasibility and associated costs of collecting and re-distributing data on individual domestic securities from existing SDBs via the existing BIS securities database application. A preliminary report on the outcome of this work should be presented to the October 2001 meeting of the IMF Committee on Balance of Payments Statistics.

20. In order to ensure the success of the projects, the Working Group is considering inviting a core group of countries to actively participate in the project. This core group could comprise: Japan, the United Kingdom, the United States and a few members of the euro area.

21. This work should be undertaken in parallel with ECB's ESCB-CSDB project, which is expected to be in its implementation phase by the second quarter of 2001. In this phase, ECB will be mapping historical data from member states and the BIS, and updating from these sources as well as from market sources and data vendors.

#### **V. POINTS FOR DISCUSSION BY THE COMMITTEE**

18. Which countries outside the euro area would like to join the Working Group to determine the need for a centralized securities database to facilitate data exchange between them? Would the ECB invite additional Member States of the euro area?

19. Based on an assessment of the content and quality of securities databases in these countries is there a need for:

- Assessing the quality of information in securities databases (SDBs) in these countries?
- Evaluating differences between SDBs (including ECB's ESCB-CSDB)?
- Identifying the elements of a model centralized SDB?
- Establishing bridges between existing SDBs and the model centralized SDB that would facilitate data exchange?
- Determining the modalities for data exchange?
- Evaluating to what extent the ESCB-CSDB would also meet the needs of countries outside the European Union?

20. Does the Committee endorse the Working Group's proposal to undertake a preliminary investigation into the feasibility and associated costs of collecting and re-distributing data on individual domestic securities from existing SDBs via the existing BIS securities database application?

### **Agenda of the Working Group on Securities Databases for 1999/2000**

- The Working Group will undertake a survey of the countries represented on the Coordinated Portfolio Investment Survey Task Force to determine: (1) the size of securities markets in those countries and the availability of data sources; (2) whether securities databases (SDBs) have been established and for what purpose; (3) the benefits to statistical compilers from the use of SDBs and their experience of start-up and maintenance costs; (4) the prospects of establishing national SDBs that serve multipurpose statistical and policy needs; (5) the use that European member countries may make of ESCB's centralized securities database (ESCB-CSDB); (6) countries' plans to establish or further develop national SDBs in the next few years; and (7) countries' views on what they would need from other countries' SDBs to address perceived deficiencies in their own SDBs (or multipurpose SDB) regarding the coverage of securities issued by their residents abroad. The Survey will also ask countries what use they plan to make of their national SDBs and, potentially, the ESCB-CSDB for the 2001 CPIS.
- The Working Group will identify the elements of a "model Centralized Securities Database" that would meet the needs of CPIS compilation in a country and facilitate data sharing between countries. In so doing, the model CSDB will distinguish between: (1) non-price attributes of securities issued and information concerning the residency and sector of the issuer; (2) price attributes of securities issued, and (3) information concerning the residency and sector of the holder. A distinction may be made between mandated items (basic needs for CPIS compilation and data sharing) and encouraged items (needed for quality control purposes).
- The Working Group will review the benefits from the adoption of standard formats and coding for the model CSDB and modalities for establishing them.

Based on this analysis the Working Group may investigate the following aspects of a supra national SDB:

- Assuming that a model CSDB can be agreed, the Working Group will offer views on how countries can establish bridge tables between their national SDBs and the model CSDB that would facilitate data exchange.
- By drawing on country experience, the Working Group will offer a preliminary assessment of the adequacy of basic data sources. This will include an assessment of the GIAM2 network, the use of ISIN masterfiles maintained by countries and the BIS, the use of commercial databases, the use of other national sources, and the work of the national compiler in "cleaning up" these sources.
- The Working Group will review the modalities for data exchange between countries. The Working Group is of the opinion that a first step towards promoting data exchange is to identify a core group of countries covering the main financial markets whose participation is needed to ensure that there are appreciable benefits of data exchange. The Working Group will recommend that this core group comprise Japan, the United Kingdom, the United States and the euro area (represented by the ECB and two or three Member States)

Because of the major impact that the ESCB's centralized CSDB will have regarding the use of securities databases in its member countries, the Working Group will recommend that further work in identifying a role for international organizations in facilitating data exchange be delayed until after the ESCB's CSDB is fully operational.

## **Benefits of Data Exchange Between National Securities Databases**

### **A. Background**

Notwithstanding the tendency for commercial securities databases to become increasingly global in their coverage of international issues, reflecting the trend towards the globalization of international securities markets, until recently, there has been little attempt to link national securities databases (SDBs) with each other to enhance their usefulness for statistical purposes.

For the 1997 Coordinated Portfolio Investment Survey (1997 CPIS), 12 of the 29 participating countries used a variant of the security-by-security approach to data collection.<sup>3</sup> Some of these purchased international commercial securities databases directly to give them access to a global database on prices of internationally traded securities based on market sources, and others to give access to a global database on the nonprice attributes of international securities issues based on the GIAM network as well as to market sources for the prices of internationally traded securities. A number of countries also made use of the securities database developed by the Ufficio Italiano dei Cambi (UIC) for the non-price attributes of international securities issues, based on data provided by national compilers in Austria, France, Italy, Portugal, and Spain. Those countries that were members of the BIS were also able to access the BIS database, through their central banks, for the non-price attributes of international bond and euronote issues. The latter facility allowed them access to selected commercial securities databases at a negotiated price and to the BIS historical files for issues in earlier periods.

A major initiative is currently being undertaken by the ECB to develop a multipurpose centralized securities database for the countries of the European Union (ECSDB). Once established, this will have systemic implications for member countries in deciding how to make best use of such a facility across a range of statistics. One implication is that it will strengthen the case for member countries to adopt a security-by-security approach to data collection for the CPIS, possibly including the 2001 CPIS.<sup>4</sup>

The following provides a summary view of the potential benefits that a country participating in the 2001 Coordinated Portfolio Investment Survey (2001 CPIS) might gain from being able to access the international SDBs of other participating countries. The prospective beneficiaries are countries that are using, or are considering using, the security-by-security approach to data collection.

### **B. Potential benefits from greater linkage between national SDBs**

There are two kinds of potential benefits to address. The first is the question of how to facilitate access by national compilers to commercial securities databases through an intermediary that can negotiate a price on their collective behalf. The second is the question of how to draw on the comparative advantage that each national compiler has in “cleaning up” data for securities issued by nonresidents in their jurisdictions.

---

<sup>3</sup> Argentina, Austria, Canada, Chile, France, Israel, Italy, Malaysia, Portugal, Spain, United States, and Venezuela

<sup>4</sup> Of the 11 euro area Member States and 4 EU “pre-in countries”, two did not participate in the 1997 CPIS (Germany and Luxembourg) and 8 used a variant of the aggregate approach to data collection (Belgium, Denmark, Finland, Ireland, Netherlands, Norway, Sweden, and the United Kingdom).

The facility offered by the BIS for shared access to selected commercial databases could, in principle, be expanded to include a wider range of commercial databases. A possible menu could be investigated, but it could include commercial databases covering the non-price attributes of international equity issues, and commercial databases covering prices of equities and debt securities.<sup>5</sup>

Commercial databases are drawn from market sources and data provided by national numbering agencies (the latter through the GIAM2 network). The reliability of these data sources may vary from country to country, but in many countries where national compilers use these sources it appears that a considerable amount of work is required by the national compilers to verify the residency and institutional sector of issues made in their country, and still more to verify the residency and institutional sector of issues made by their residents in other countries. For this reason, there may be a comparative advantage in requesting national compilers to collect and verify information on securities issued in their country that is needed by national compilers in other countries. The understanding would be that equivalent data would be given in return.

A particular focus could be on verification of the country of residence of the issuer, the institutional sector of the issuer, and direct investment relationships affecting the issuer (including the country of residence of the direct investor). An additional focus could be on domestic issues and private placements that may not be assigned an ISIN or equivalent code and may not be covered in commercial databases. For these, national compilers in the country of issue could be expected to assess the availability of data sources and introduce collections as appropriate to meet their own needs. To meet the needs of national compilers in other countries, the country of residence of the issuer should be identified.

### **C. Prerequisites**

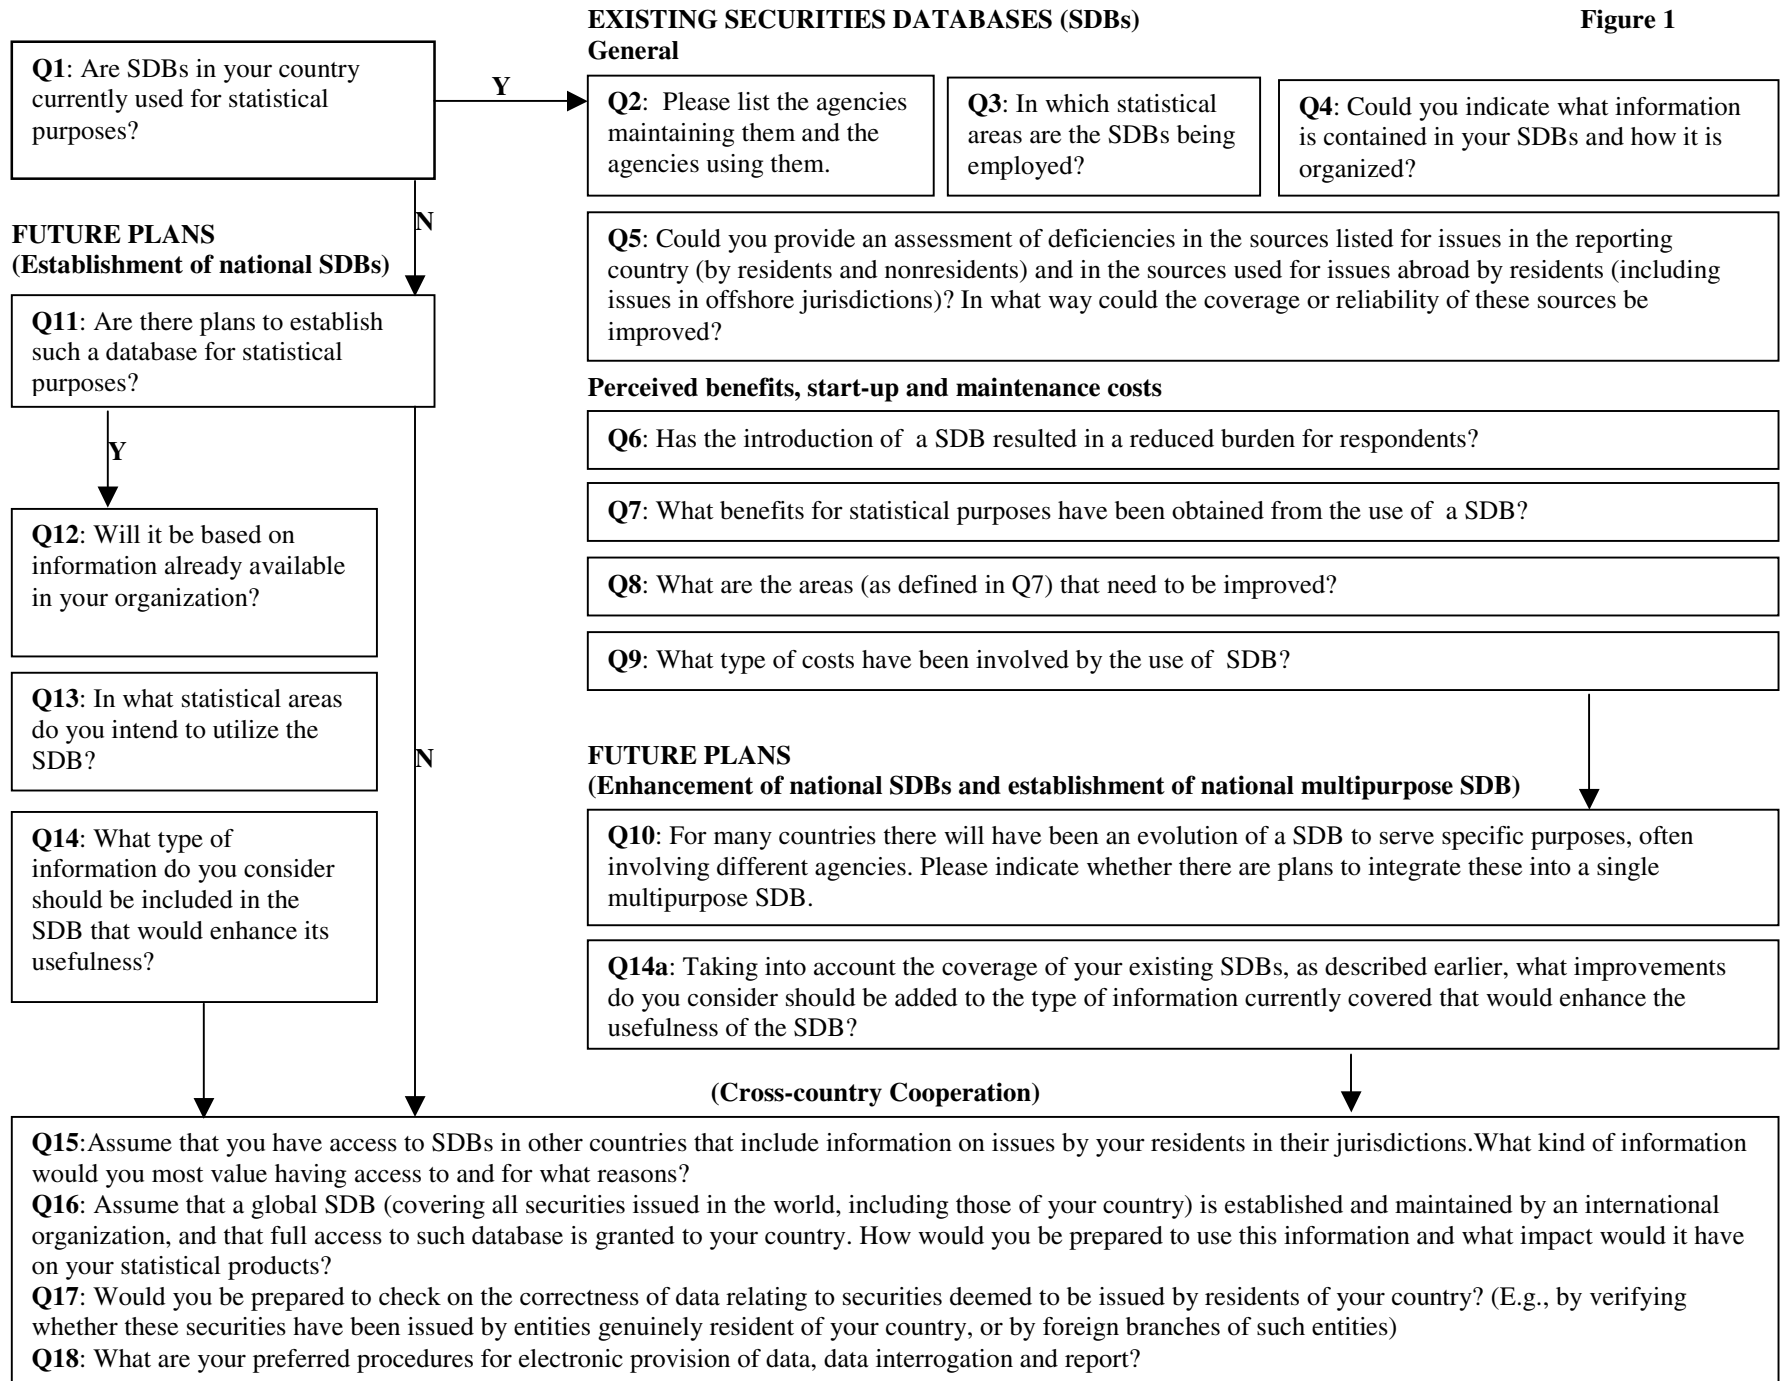

The main prerequisites for realizing these benefits are agreement on: (1) the elements of a core centralized SDB that national compilers would commit to, both to meet their own needs and the needs of other (specified) national compilers; (2) the development and use of standard formats and coding to facilitate the process of data exchange; and (3) the development of modalities for data sharing between participating countries.

In the past, international securities issues have tended to be concentrated in the main industrial country financial markets. For this reason, the identification of a core group of countries in a program of data exchange would be essential to ensure that the bulk of international security issues is included. This core group could comprise the United States, Japan, the United Kingdom, and the euro area (represented by the ECB and two or three Member States). On the grounds of providing a reasonably complete coverage of international security issues, consideration could be given to identifying a larger targeted group to include other European Union member countries, Argentina, Australia, Brazil, Canada, Hong Kong, Mexico, Switzerland, Venezuela, some selected offshore financial centers (Cayman Islands and Netherlands Antilles), and international organizations with substantial portfolio investments. Obviously, there would be an incentive to include all participating countries in the CPIS.

---

<sup>5</sup> This is not meant to imply that the BIS should undertake this role, rather that the BIS experience demonstrates that such a role by an international organization is feasible.
